DOCUMENT STATUS LOG

	DOCUMENT STAT	00 200	
Issue	Change Description	Date	Approval
0.1	First draft version	23/05/02	
1.0	First release	19/07/02	
2.0	Second release	29/11/02	
2.1	Maintenance release	13/05/03	
2.2	Added the following functions: • xp_target_extra_aux • xp_target_extra_target_to_sun • xp_target_extra_ef_to_sat • xp_converterAdded the following functions: • xp_target_extra_aux • xp_target_extra_target_to_sun • xp_target_extra_ef_to_sat • xp_converterAdded the following functions: • xp_target_extra_aux • xp_target_extra_aux • xp_target_extra_aux • xp_target_extra_target_to_sun • xp_target_extra_target_to_sat • xp_target_extra_ef_to_sat • xp_converter	30/09/03	
3.0	Completely new initialization strategy and attitude functions.	21/07/04	
3.1	New attitude models implemented. New multitarget functions.New attitude models implemented. New multitarget functions.New attitude models implemented. New multitarget functions.	13/10/04	
3.2	DEM Model implementation.DEM Model implementation.DEM Model implementation.	15/11/04	
3.3	New features:	11/07/05	

Date:

Issue: 10/05/2019

	 Idenfier accessorsNew features: xp_target_travel_time New attitude models (Cryosat YSM, ADM model) New attitude files for initialization Identifier accessors 		
	New features:		
	New attitude model for ADM		
	xp_dem_compute		
	 xp_target_reflected and xp_target_extra_specular_reflection (only interface definition) 		
	 xp_target_extra_target_to_moon 		
	 New axis for the generic attitude models: 		
	- XP_SC_EF_VEL_VEC		
	XP_ORBIT_POLENew features:		
	New attitude model for ADM		
	xp_dem_compute		
	 xp_target_reflected and 		
3.4	xp_target_extra_specular_reflection (only interface definition)	18/11/05	
	 xp_target_extra_target_to_moon 		
	 New axis for the generic attitude models: 		
	XP_SC_EF_VEL_VEC		
	XP_ORBIT_POLENew features:		
	 New attitude model for ADM 		
	xp_dem_compute		
	 xp_target_reflected and 		
	xp_target_extra_specular_reflection (only interface definition)		
	 xp_target_extra_target_to_moon 		
	New axis for the generic attitude models:		
	- XP_SC_EF_VEL_VEC		
	XP_ORBIT_POLE		
	Maintenance release		
	New features:		
	Aberration correction for Cryosat attitude		
	based on star-trackersMaintenance release		
3.5	New features:	26/05/06	
	Aberration correction for Cryosat attitude based on star-trackersMaintenance release		
	New features:		
	Aberration correction for Cryosat attitude		
	based on star-trackers		
	based on star-trackers		

Date:

Issue: 10/05/2019

	Maintenance release		
	New features:		
	 New attitude models for SENTINEL 1A and 1B 		
	New Axis defined: XP_INERTIAL_POS_VEC_CORRECTED		
	and XP_INERTIAL_VEL_VEC_ROTATEDMaint enance release		
	New features:		
3.6	 New attitude models for SENTINEL 1A and 1B 	24/11/06	
	New Axis defined: XP_INERTIAL_POS_VEC_CORRECTED and XP_INERTIAL_VEL_VEC_ROTATEDMaint angles release.		
	enance release New features:		
	New attitude models for SENTINEL 1A and 1B		
	 New Axis defined: XP_INERTIAL_POS_VEC_CORRECTED and XP_INERTIAL_VEL_VEC_ROTATED 		
	Maintenance release		
	New features:		
	Function expcfi_check_libs		
	 Library version for MAC OS X on Intel (32 and 64-bits)Maintenance release 		
	New features:		
3.7	Function expcfi_check_libs	13/07/07	
	 Library version for MAC OS X on Intel (32 and 64-bits)Maintenance release 		
	New features:		
	Function expcfi_check_libs Continue = Continue		
	Library version for MAC OS X on Intel (32 and 64-bits)		
3.7.2	Maintenance release	13/07/07	
	New features:		
	Support for missalignment for attitude frame		
	Azimuth and Elevation definition for attitude frames		
	Improvement in the quaternion interpolationMaintenance release		
	New features:		
	Support for missalignment for attitude frame Azimuth and Elevation definition for attitude		
	Azimuth and Elevation definition for attitude		

Date:

Issue: 10/05/2019

	frames Improvement in the quaternion interpolationMaintenance release New features: Support for missalignment for attitude frame Azimuth and Elevation definition for attitude frames Improvement in the quaternion interpolation		
4.0	Maintenance releaseMaintenance releaseMaintenance release	19/01/09	
4.1	Maintenance release. New features: Pointing functions support DEM GETASSEv2 Sentinel-1 attitude model (roll steering) Instrument offsets for attitude computations	07/05/10	
4.2	Maintenance release. New features: • Support to DEM ACE2 9SEC		
4.3	Maintenance release. New features: Raytracing model in target fucntions determined by input atmos_id New attitude model for SENTINEL2 (XP_MODEL_SENTINEL2)		
4.4	Maintenance release. New features: Support for GEO satellites: New Yaw flip attitude New function xp_target_sc Option to use a memory cache for DEM computations. New function to configure cache New function xp_target_list_inter		

Date:

Issue: 10/05/2019

4.5	Maintenance release New features: New functions: xp_target_list_extra_vector xp_target_list_extra_main xp_target_list_extra_aux xp_target_list_extra_ef_target xp_target_list_extra_specular_reflection xp_target_list_extra_target_to_moon xp_target_list_extra_target_to_sun New DEM algorithm of maximum heights		
4.6	Maintenance release New features: New function xp_attitude_define. Internal improvements for runtime performance in DEM computations.		
4.7	Maintenance release	28/03/14	
4.8	Maintenance release New features: • Added support for Earth Fixed input in initialization of satellite nominal attitude with harmonics.	29/10/2014	
4.9	Maintenance release	23/04/2015	
4.10	Maintenance release New features: Support for DEM ACE2 30 secs Target functions: possibility of considering light travel time in target computation Run-time improvements in target functions	29/10/2015	

Date:

Issue: 10/05/2019

4.11	Maintenance release New features: • Support for DEM ACE2 3 secs • New functions xp_gen_attiude_data and xp_gen_attitude_file	15/04/2016	
4.12	Maintenance release	03/11/2016	
4.13	Maintenance release	05/04/2017	
4.14	Maintenance release New features: • Support for MetOp-SG attitude law • New function xp_free_target_id_data	16/11/2017	
4.15	Maintenance release	20/04/2018	
4.16	Maintenance release New features: • Support for DEM ACE2 5 minutes	09/11/2018	
4.17	Maintenance release New features: • xp_dem_get_cell_value • xp_dem_get_cell_geod	10/05/2019	

Date:

Issue: 10/05/2019

2.2 Nomenclature

CFI A group of CFI functions, and related software and documentation that will be distributed

by ESA to the users as an independent unit

CFI function A single function within a CFI that can be called by the user

Library A software library containing all the CFI functions included within a CFI plus the

supporting functions used by those CFI functions (transparently to the user)

2.3 Note on Terminology

In order to keep compatibility with legacy CFI libraries, the Earth Observation Mission CFI Software makes use of terms that are linked with missions already or soon in the operational phase like the Earth Explorers.

This may be reflected in the rest of the document when examples of Mission CFI Software usage are proposed or description of Mission Files is given.

4 INTRODUCTION

4.1 Functions Overview

This software library contains the CFI functions required to perform accurate computation of pointing parameters from and to a satellite for various types of targets.

It includes a set of functions to initialize the attitude of the platform and the instruments. The values provided by these functions are later used by all the other functions of the library.

A detailed description of each function is provided in Section 7.

Please refer also to:

[MCD] for a detailed description of the time references and formats, coordinate systems, parameters and models used in this document

[GEN_SUM] for a complete overview of the CFI, and in particular the detailed description of the *Id* concept and usage and the error handling functions.

Issue: 10/05/2019

Page: 45

4.1.1 Attitude Data Flow

The following figure shows the typical data flow for the attitude functions. First, the different transformations between the various reference frames are initialised. Then, given the spacecraft position, the attitude is calculated:

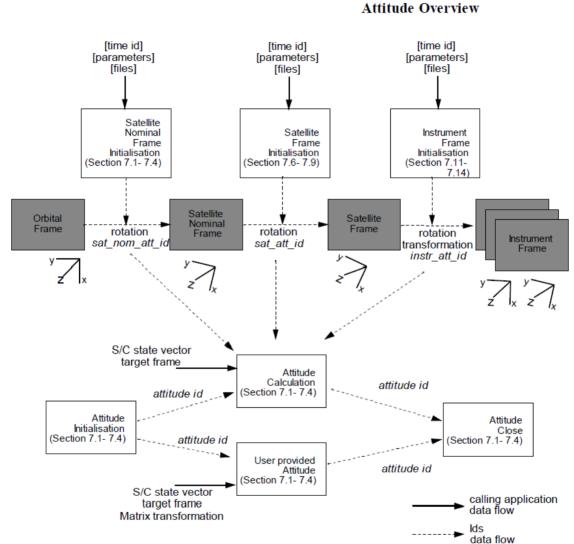

Figure 1: Attitude Initialization Overview

Date:

Satellite Initialisation

Issue: 10/05/2019

Page: 46

Each different transformation can be initialised with different models (note that all the attitudes can be initialized at the same time using the function xp_atttitude_define (see section 7.47) and an Attitude definition file):

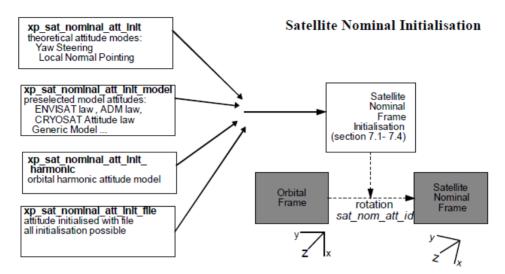

Figure 2: Satellite Nominal Initialization

4.1.2 Geolocation Routines Data Flow

The following figure shows the tipical data flow for the geolocation routines functions. First, the attitude should be calculated, and, if needed, the refraction and Digital Elevation Models initialised.

Geolocation Routines Data Flow [attitude definition file] [attitude files] results selection [attitude parameters] geolocation parameters target selection orbit state vector target id target id attitude Target Result lds Target Routines Attitude Close Initialisation ld Routines (aeolocation) Line of Sight attitude ids (xp_target_xxx) xp target extra xxx Defined (See Figure 2) atmos attitude Refraction ld Initialisation ancillary (atmos id Number of targets results atmos dem id Elevation Model Initialisation (dem id calling application data flow ld based data flow

Page: 49

The table below and the diagrams on the next pages describe the various **xp_target_<function>**.

Table 1: xp_target functions

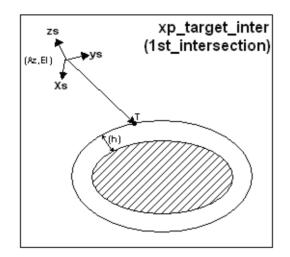

xp_target_ <function></function>	Description
xp_(multi)_target_ inter xp_target_list_inter	It calculates the intersection point(s) of the line of sight defined by an elevation and an azimuth angle (or a set of them) expressed in the input Attitude frame, with a surface(s) located at a certain geodetic altitude(s) over the Earth.
xp_(multi)_target_ travel_time	It calculates the point of the line or sight from the satellite (defined by an elevation and an azimuth angle expressed in the selected Attitude Frame) at a given travel time(s) along the (curved) line of sight.
xp_target_ground _range	It calculates the location of a point that is placed on a surface at a certain geodetic altitude over the Earth, that lays on the plane defined by the S/C position, the nadir and a reference point, and that is at a certain distance or ground range measured along that surface from that reference point. This reference point is calculated being the intersection of the previous surface with the line of sight defined by an elevation and azimuth angle in the input Attitude coordinate system.
xp_target_inciden ce_angle	It calculates the location of a point that is placed on a surface at a certain geodetic altitude over the Earth and that is seen from the S/C on a line of sight that forms a certain azimuth angle in the input Attitude frame and that intersects that surface with a certain incidence angle.
xp_target_range	It calculates the location of a point that is placed on a surface at a certain geodetic altitude over the Earth, that is seen from the S/C on a line of sight that forms a certain azimuth angle in the input Attitude frame, and that is at a certain range or slant-range from the S/C.
xp_target_range_r ate	It calculates the location of a point that is placed on a surface at a certain geodetic altitude over the Earth, that is at a certain range from S/C, and whose associated Earth-fixed target has a certain range-rate value.
xp_target_tangent	It calculates the location of the tangent point over the Earth that is located on the line of sight defined by an elevation and azimuth angles expressed in the input Attitude frame.
xp_target_altitude	It calculates the location of the tangent point over the Earth that is located on a surface at a certain geodetic altitude over the Earth and that is on a line of sight that forms a certain azimuth angle in the input Attitude frame.
xp_target_star	It calculates the location of the tangent point over the Earth that is located on the line of sight that points to a star defined by its right ascension and declination coordinates.
xp_target_generic	The cartesian state vector of the target is taken as an input.
xp_target_tangent _sun	It calculates the location of the tangent point over the Earth that is located on the line of sight that points to the Sun
xp_target_tangent _moon	It calculates the location of the tangent point over the Earth that is located on the line of sight that points to the Moon
xp_target_station	It calculates the most relevant observation parameters of the link between the satellite and a ground station
xp_target_sc	It calculates the most relevant observation parameters of the link between one satellite and another Satellite.

Issue: 10/05/2019

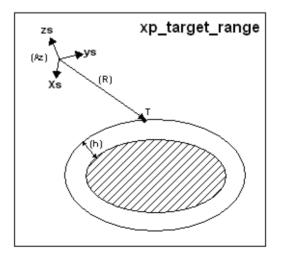

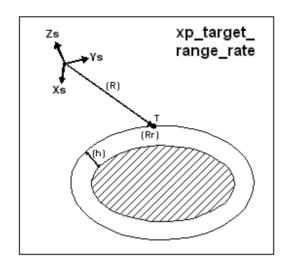

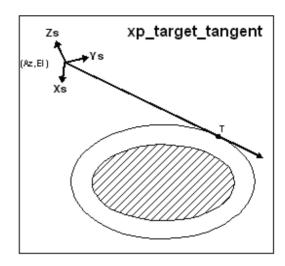

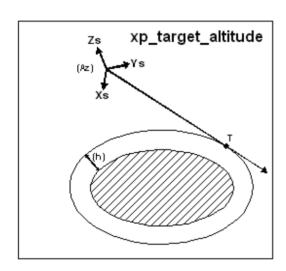

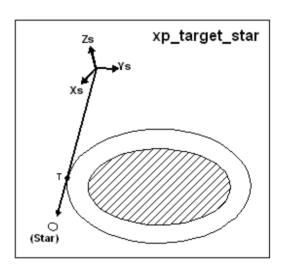

Date:

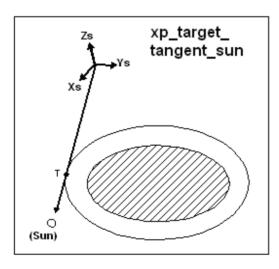

Issue: 10/05/2<u>Q</u>.1₁9₇

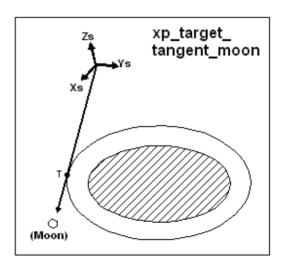

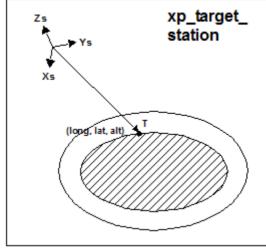

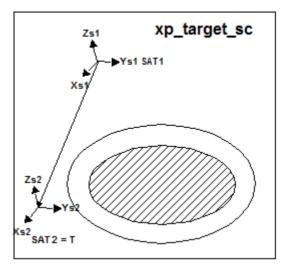

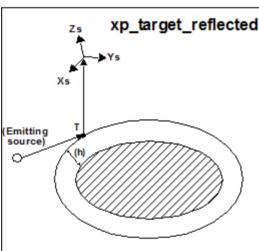

Date:

Issue: 10/05/20 197

Page: 52

[Xs,Ys,Zs] = Attitude F rame

() = Input data to the mode

(Az,EI) = Azimuth + Elevation of the LOS

(h) = Geodetic altitude of the target

(R) = Range Satellite \Leftrightarrow Reference Point/Target

(D) = Distance or Ground range Ref. Point ⇔ Target

(In) = Incidence angle of the LOS

(Rr) = Range-rate of the Earth-fixed target

T = Target

SSP = Sub Satellite Point = Nadir of the satellite

Rp = Reference Point

N = Normal vector to the surface at a geodetic altitude = h

As it can be seen from the list of functions, there are some functions that calculate several targets (xp_multi_target_xxxx, xp_target_list_inter). The number of targets found by the functions is returned through the interface.

In addition to these "user" targets, two other categories of targets can be defined, "LOS" targets and "DEM" targets.

4.1.2.1 **LOS** targets

The idea is to get information about all the ray path points computed by a specific target routine along the Line of Sight (LOS) trajectory.

For every target routine, the output parameter num_los_target will return the number of points in the path. It applies when the variable "target type" is equal to XP LOS TARGET TYPE.

1. Start point of LOS

The spacecraft position (Instrument CS) shall be considered as the start point for the LOS path.

Date:

Issue: 10/05/2019

Page: 53

2. Stop point of LOS

The stop point for the LOS path will be different depending on the selected target function; nominally it will be the resulting target point.

- xp_target_inter, xp_target_list_inter and xp_multi_target_inter: 1st or 2nd intersection point (Point corresponding to the last altitude for the multi-target routine)
- xp target ground range: Target point
- xp target incidence angle: Target point
- xp target range: Target point
- xp target range rate: Target point
- xp_target_tangent: Two different cases to consider depending on whether refraction is selected or not:
 - No refraction mode: Tangent point
 - Refraction mode:
 - ☐ The 2nd intersection point with a surface located at Refraction Model Maximum Height (geodetic altitude) over the Earth if tangent height <= Refraction Model Maximum Height
 - □ The tangent point if tangent height > Refraction Model Maximum Height
- xp target altitude: Point at selected altitude
- xp target star: Two different cases to consider depending on whether refraction is selected or not:
 - No refraction mode: Tangent point
 - Refraction mode:
 - ☐ The 2nd intersection point with a surface located at Refraction Model Maximum Height (geodetic altitude) over the Earth if tangent height <= Refraction Model Maximum Height
 - ☐ The tangent point if tangent height > Refraction Model Maximum Height
- xp target station: Ground Station position
- xp target generic: Target position
- xp target reflected: Reflection point
- xp_target_travel_time and xp_multi_target_travel_time: Point at selected travel time (Point corresponding to the last travel time for the multi target routine)
- xp target tangent sun: Tangent point
- xp target tangent moon: Tangent point
- xp target sc: Target position.

4.1.2.2 DEM targets

A DEM Target is defined as the intersection of a line of sight with the Earth Surface defined using a digital elevation model (DEM).

Date:

Issue: 10/05/2019

Page: 54

A DEM Target is calculated using as line of sight the LOS targets that has been computed previously with a target routine (Note that such LOS consist in a polygonal line, no necessarily a straight line). Consequently, to get a DEM target it is necessary to follow these steps:

- Initialize the DEM model using the xp dem init routine and a configuration file (Section 7.60).
- One call to the target routine for getting the LOS targets.
- One call to the target extra routine requesting the DEM target.

The digital elevation model of the Earth consists in a set of points defining a grid for which a measure of the altitude over the Earth reference ellipsoid is given. The altitude of the points within each cell of the grid is computed by the CFI using a bilinear interpolation with the points of the corner of the cell. Details about the bilinear algorithm used to compute the intersection can be seen in [LOS ALG].

4.1.2.3 Light propagation model

When the light propagation model is enabled, the target functions keep into account the time spent by a generic signal traveling at the speed of light to:

- in the TRANSMITTER mode: go from the satellite to the target;
- in the RECEIVER mode: go from the target to the satellite.

Two distinct times are considered:

- 1) The satellite time (T) is the time provided as input to the target function. It is:
 - in the TRANSMITTER mode: the time at which the satellite (instrument) emits the signal towards the target;
 - in the RECEIVER mode: the time at which the satellite (instrument) receives the signal emitted by the target.
- 2) The target time is the satellite time T plus or minus the light travel time between satellite and target (dT). It is:
 - in the TRANSMITTER mode: T+dT, i.e. the target receives the signal sent by the satellite with a delay dT;
 - in the RECEIVER mode: T-dT, i.e. the satellite receives the signal emitted by the target with a delay dT.

dT is calculated as the light travel time from the satellite to target calculated with dT=0. When the light propagation model is not activated, it is assumed dT=0, therefore target and satellite are considered at the same time T.

According to the definitions above, the Line of Sight (LOS) can be defined as the segment joining satellite and target at their correspondent times.

For the following functions the calculation method is slightly different:

- xp target range: the input range is used to calculate the light travel time;
- xp target travel time: the input travel time is used as dT;

Date:

Issue: 10/05/20 197

Page: 55

• xp_target_generic, xp_target_sc: in this case the input is the target at time T+/-dT. The function estimates the target at T to compute the line of sight parameters also considering (if provided as inputs) velocity and acceleration of the target.

Target geometric properties (returned by the extra functions) are evaluated considering the two distinct times, for example:

- The target position (i.e. position in EF co-ordinates and geodetic co-ordinates) is evaluated at time T-dT:
- Direction from satellite to target and viceversa are evaluated considering the satellite position at time T and target position at time T+/-dT;
- Direction from target to e.g. sun/moon take into account the target position at T+/-dT and other celestial bodies at the same time.

Following figure 6. shows an example using the xp target inter function.

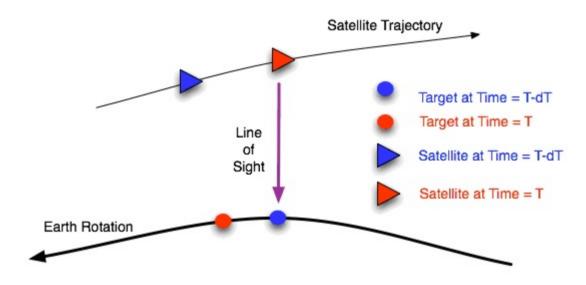

Figure 6: Example of light travel time with xp_target_inter

The light propagation mode is set to RECEIVER and input azimuth, elevation are **0**, **90 deg** (assuming a local normal pointing). The signal is emitted by the target at time T-dT (blue point, let's assume at geodetic co-ordinates (lon,lat,h) and EF co-ordinates (X,Y,Z)) and is received by the satellite at time T (red triangle). Due to Earth rotation, at time T the observed target has moved to the red point.

Here are some examples of results from xp target extra... functions:

- xp target extra vector:
 - Target position: the vector (**X**,**Y**,**Z**), i.e. the target point considered at T-dT;

Date:

Issue: 10/05/20 1/97

Page: 56

- Direction LOS: the vector corresponding to the purple line in Fig. X (it is the line joining satellite position at time T and target position at time T-dT);

- xp_target_extra_main:
 - Target geodetic co-ordinates: (lon,lat,h)
 - Satellite to target azimuth, elevation: **0,90**, i.e. the same azimuth and elevation used as input for xp target inter.
 - Target to satellite azimuth, elevation: **0,90**, this is the view direction from the target at time T-dT to the satellite at time T.

The same results are given by the xp_target_extra... functions if the xp_target_generic is called with input target at EF co-ordinates (X,Y,Z) and velocity set to zero.

To activate the light propagation mode the *model_id* structure must be initialized using the function xl model init as follow:

1) for TRANSMITTER mode:

2) for RECEIVER mode:

```
#include <explorer_lib.h>
{
   long mode, models[XL_NUM_MODEL_TYPES_ENUM];
   xl_model_id model_id = {NULL};
```

5 LIBRARY INSTALLATION

For a detailed description of the installation of any CFI library, please refer to [GEN_SUM].

Date:

Issue: 10/05/20 1/97

Page: 59

6 LIBRARY USAGE

The EO POINTING software library has the following dependencies:

- Other EOCFI libraries:
 - EO FILE HANDLING (See [F H SUM]).
 - EO DATA HANDLING (See [D H SUM]).
 - EO_LIB (See [LIB_SUM]).
- Third party libraries:
 - POSIX thread library: libpthread.so (Note: this library is normally pre-installed in Linux and MacOS platforms. For Windows platforms, pthread.lib is included in the distribution package, with license LGPL);
 - GEOTIFF, TIFF, PROJ, LIBXML2 libraries (these libraries are included in the distribution package. Their usage terms and conditions are available in the file "TERMS AND CONDITIONS.TXT" which is part of the distribution package).

In order to improve run-time performance, some functions (e.g. xp_target_list_extra_vector, xp_target_list_extra_main, xp_target_list_extra_aux, xp_target_list_extra_ef_target, xp_target_list_extra_target_to_sun, xp_target_list_extra_target_to_moon, xp_target_list_extra_specular_reflection) perform their computations in multi-threading mode.

The multi-threading code of the Pointing functions uses the OpenMP API (see http://en.wikipedia.org/wiki/OpenMP).

OpenMP is not supported in the clang compiler, therefore such functions work in single-thread mode in MacOS.

The following is required to compile and link a Software application that uses the EO_POINTING software library functions (it is assumed that the required EOCFI and third-part libraries are located in directory *cfi_lib_dir* and the required header files are located in *cfi_include*, see [GEN_SUM] for installation procedures):

- 1) include the following header files in the source code:
 - explorer pointing.h (for a C application)
- 2) use the following compile and link options:

Linux platforms:

- -Icfi_include_dir -Lcfi_lib_dir -lexplorer_pointing
- -lexplorer_lib lexplorer_data_dandling -lexplorer_file_handling -lgeotiff -ltiff -lproj -lxml2 -lm -lc -lpthread -fopenmp

MacOS platforms (openmp is not supported):

-Icfi include dir -Lcfi lib dir -lexplorer pointing

Date:

Issue: 10/05/20 197

Page: 60

-lexplorer_lib - lexplorer_data_dandling -lexplorer_file_handling -lgeotiff -ltiff -lproj -lxml2 -lm -lc -lpthread

Windows platforms:

/I "cfi_include_dir" /libpath: "cfi_lib_dir" libexplorer_pointing.lib

libexplorer_lib.lib libexplorer_data_handling.lib libexplorer_file_handling.lib libgeotiff.lib libtiff.lib libproj.lib libxml2.lib pthread.lib Ws2 32.lib /openmp

All functions described in this document have a name starting with the prefix xp

To avoid problems in linking a user application with the EO_POINTING software library due to the existence of names multiple defined, the user application should avoid naming any global software item beginning with either the prefix XP or XP.

It is possible to call the following CFI functions from a user application.

Table 2: CFI functions included within EO_POINTING library

Function Name	Enumeration value	Long
Main CFI Functions		
xp_sat_nominal_att_init	XP_SAT_NOMINAL_ATT_INIT_ID	0

	Error Handling Functions			
xp_verbose	not applicable			
xp_silent				
xp_get_code				
xp_get_msg				
xp_print_msg				

Notes about the table:

- To transform the extended status flag returned by a CFI function to either a list of error codes or list of error messages, the enumeration value (or the corresponding long value) described in the table must be used
- The error handling functions have no enumerated values

Whenever available it is strongly recommended to use enumeration values rather than integer values.

6.1 Usage hints

The runtime performances of some of the CFI functions are improved to a large extent if they are called two consecutive times keeping constant some of their inputs.

Date:

Issue: 10/05/20 197

Page: 63

Nevertheless, although the user may not need to call the CFI functions two consecutive times with the same inputs, there are internal functions that are actually called in those conditions, and thus improving the runtime performances of the former.

Thus, the runtime improvement is achieved with any sequence of calls to those CFI functions, not only with a sequence of calls to the same function.

In fact, the time, position, velocity, acceleration vectors, AOCS and mispointing angles do not need to keep exactly constant as long as the difference between two consecutive calls lays within the following thresholds:

Time: 0.0864 microsec
Position vector: 0.6e-3 m
Velocity vector: 0.6e-6 m/s
Acceleration vector: 0.6e-9 m/s²

AOCS: 5e-9 deg

• Mispointing angles: 5e-9 deg

• Mispointing angles-rate: 5e-12 deg

• Mispointing angles-rate-rate: 5e-15 deg

Every CFI function has a different length of the Error Vector, used in the calling I/F examples of this SUM and defined at the beginning of the library header file. In order to provide the user with a single value that could be used as Error Vector length for every function, a generic value has been defined (XP_ERR_VECTOR_MAX_LENGTH) as the maximum of all the Error Vector lengths. This value can therefore be safely used for every call of functions of this library.

6.2 General Enumerations

The aim of the current section is to present the enumeration values that can be used rather than integer parameters for some of the input parameters of the EO_POINTING routines, as shown in the table below. The enumerations presented in [GEN_SUM], [F_H_SUM] and [LIB_SUM] are also applicable.

Table 3: Enumerations within EO_POINTING library

Input	Description	Enumeration value	Long
Time Initialization	Initialization from file (data-driven)	XP_SEL_FILE	0
Mode	Initialization within a time range	XP_SEL_TIME	1
	Initialization within a range of orbits	XP_SEL_ORBIT	2
	(not used in POINTING)	XP_SEL_DEFAULT	3
Earth Intersection	No intersection with Earth geoid	XP_NO_INTER	0

6.3 Data Structures

The aim of the current section is to present the data structures that are used in the EO_POINTING library. The structures are currently used for the CFI Identifiers accessor functions. The following table show the structures with their names and the data that contain:

Table 4: EO_POINTING structures

Structure name	Data		
	Variable Name	C type	Description
xp_param_model_ str	model_param	double [XP_NUM_MODEL_ PARAM]	Model Parameters
	model_enum	long	Model type
xp_harmonic_data	num_terms	long [3]	Number of harmonics coefficient(pitch, roll and yaw)
	harmonic_type_pitch	long [XP_MAX_NUM_HA RMONIC]	Harmonic type
	harmonic_type_roll	long [XP_MAX_NUM_HA RMONIC]	Harmonic type
	harmonic_type_yaw	long [XP_MAX_NUM_HA RMONIC]	Harmonic type
	harmonic_coef_pitch	double [XP_MAX_NUM_HA RMONIC]	Harmonic coefficient
	harmonic_coef_roll	double [XP_MAX_NUM_HA RMONIC]	Harmonic coefficient
	harmonic_coef_yaw	double [XP_MAX_NUM_HA RMONIC]	Harmonic coefficient
xp_harmonic_mod	angle_type	long	Angle type
el_str	harmonic	xp_harmonic_data	Harmonic data
xp_att_data_rec	time_ref	long	Time reference
	time	double	Time for the quaternions/angles
	quaternion	double [4]	Quaternions
	angles	double [3]	Angles
	file_model	long	File model
xp_sat_nom_att_fil	val_time0	double	Validity start time

Date:

Issue: 10/05/2019

e_model_str	val_time1	double	Validity stop time
	data_type	long	0 = quaternions
			1 = angles
	inertial_frame	long	initial reference frame: Inertial refer ence frame
	lines	long	number of records in the attitude lists
	max_gap	double	Maximum gap between consequtive data
	att_data	xp_att_data_rec*	array with the angle/quaternion records
xp_angle_model_s	pitch	double	Pitch
tr	roll	double	Roll
	yaw	double	Yaw
xp_matrix_model_ str	att_matrix	double [3][3]	Attitude matrix
xp_star_tracker	quaternion[4]	float	Quaternions
	time	double	Quaternion time in TAI
	status	unsigned char	Quaternions status
xp_star_tracker_au	star_tr_id	long	Star tracker Id (1,2 or 3)
x	aberr_correction	long	Aberration correction flag: -1 = Aberration correction with trans posed matrix 0 = No aberration 1 = Aberration correction
	str_att_rot	double [3][3]	Satellite attitude frame to star tracker rotation matrix
xp_sat_att_file_mo	file_model	long	file model
del_str	val_time0	double	Validity start time
	val_time1	double	Validity stop time
	data_type	long	0 = quaternions 1 = angles
	inertial_frame	long	initial reference frame
	lines	long	number of records in the attitude lists
	max_gap	double	Maximum time gap between angles or quaternions
	att_data	xp_att_data_rec*	Array with the angle/quaternion records
	aux_data	xp_star_tracker_aux	Data from the auxiliary file
	tm_data	xp_star_tracker*	Cryosat Star Tracker attitude data
	rot_to_sat	double**	Matrix with the rotation from the frame

Date:

Issue: 10/05/2019

			based on the satellite to the satellite frame.
xp_instr_att_file_	file_model	long	File model
model_str	val_time0	double	Validity start time
	val_time1	double	Validity stop time
	data_type	long	0 = quaternions 1 = angles
	inertial_frame	long	initial reference frame
	lines	long	number of records in the attitude lists
	max_gap	double	Maximum gap between quaternions/ angles
	att_data	xp_att_data_rec*	array with the angle/quaternion records
xp_quat_plus_angle	inertial_frame	long	Inertial reference frame
_model_str	num_quat	long	Number of quaternions
	quat	xd_att_rec*	List of quaternions
	angles	double[3]	Rotation angles
xp_quat_plus_matri	inertial_frame	long	Inertial reference frame
x_model_str	num_quat	long	Number of quaternions
	quat	xd_att_rec*	List of quaternions
	rot_matrix	double[3][3]	Rotation matrix
xp_attitude_id_dat a	model	long	Attitude model
	time_ref	long	Time reference
	time	double	Time
	sat_vector	xl_cord	Satellite vector (EF)
	source_frame	long	Source reference frame (according to the extended reference frames enu meration in [LIB_SUM])
	target_frame	long	Target reference frame according to the Attitude Frame ID enumeration, defined in the current document (see Table 3)
	sat_mat	xl_cs_tra	Attitude matrix. Provides transformation from source to target frame
	offset	double [3]	Instrument offset from initial reference frame
	attitude_EF	xl_cs_tra	Attitude matrix in EF: position and orientation of the instrument/satellite frame.
xp_atmos_id_data	atm_max_alt_std	double	Standard atmosphere geometric

Date:

Issue: 10/05/2019

			altitude
	atm_max_alt_user	double	User atmosphere geometric altitude
xp_dem_ace	dir	char [100]	Directory for the the DEM files
(deprecated)	res_X	double	Interval between points along X-axis
	res_Y	double	Interval between points along Y-axis
	res_unit	double	Conversion factor from x,y units to the res_X, res_Y units. for example if res_X is given in seconds and X in degrees => res_unit=3600
	X_num_points	long	Number of points along X-axis (columns)
	Y_num_points	long	Number of points along Y-axis (lines)
	x_range	double	Longitude of the x-axis for one file (grid)
	y_range	double	longitude of the y-axis for one file (grid)
	data_size	long	Size in bytes of the data stored in the files
	data_type	long	data type (int, long, float, double)
	north_alt	double[4]	Altitude at the North pole cell
	south_alt	double[4]	Altitude at the South pole cell
xp_dem_id_data	model	long	DEM model
	dem_data	xp_dem_ace *	DEM configuration data (deprecated)
	dem_user_params	xd_dem_user_params	DEM user parameters (see [D_H_SUM])
	dem_metadata	xd_dem_metadata	DEM metadata (see [D_H_SUM])
xp_dem_info	dem_model	long	DEM model (according to XD_Dem_model_enum in [D_H_SUM])
	data_source	long	Source flag. According to the dem _model, the value is one of the following enumerations (see [D_H_SUM]):
			DEM Data Source Types for GETASSE30 v1, v2 and v3
			DEM Data Source Types for ACE2
			DEM Data Source Types for GDEM v2
xp_generic_data	time_ref	long	Time reference
	time	double	Time
	sat_vector	xl_cord	Satellite state vector (see [LIB_SUM])

Date:

Issue: 10/05/2019

	iray	long	Refraction model
	freq	double	Frequency
	deriv	long	Derivative flag according to deriva tives enumeration in [LIB_SUM]

7 CFI FUNCTIONS DESCRIPTION

The following sections describe each CFI function.

The calling interfaces are described for C users.

Input and output parameters of each CFI function are described in tables, where C programming language syntax is used to specify:

- Parameter types (e.g. long, double)
- Array sizes of N elements (e.g. param[N])
- Array element M (e.g. [M])

Date:

Issue: 10/05/2019

Page: 80

7.1 xp_sat_nominal_att_init

7.1.1 Overview

The **xp_sat_nominal_att_init** CFI function initialises the AOCS mode for a given satellite. The initialised mode will be stored in the *sat nom trans id* output structure.

7.1.2 Calling Interface

The calling interface of the **xp_sat_nominal_att_init** CFI function is the following (input parameters are <u>underlined</u>):

The XP_NUM_ERR_SAT_NOM_ATT_INIT constant is defined in the file *explorer_pointing.h*.

Date:

Issue: 10/05/2019

Page: 81

7.1.3 Input Parameters

The xp_sat_nominal_att_init CFI function has the following input parameters:

Table 5: Input parameters of xp_sat_nominal_att_init function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
aocs_mode	long *	-	AOCS Mode ID	-	Complete

It is possible to use enumeration values rather than integer values for some of the input arguments: AOCS Mode ID: aocs_mode. See current document, Table 3.

7.1.4 Output Parameters

The output parameters of the **xp_sat_nominal_att_init** CFI function are:

Table 6: Output parameters of xp_sat_nominal_att_init

C name	C type	Array Element	Description (Reference)	Unit	(Format)	Allowed Range
sat_nom_trans_id	xp_sat_nom _trans_id*		Structure that contains the Satellite nominal Transformation	-		-
ierr	long	-	Error vector	-		-

7.1.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_sat_nominal_att_init** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_sat_nominal_att_init** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM])

Table 7: Error messages of xp_sat_nominal_att_init function

Error type	Error message	Cause and impact	Error code	Error No
ERR	Memory allocation error	•	XP_CFI_SAT_NOMINAL_ATT_ INIT_MEMORY_ERR	0

Date:

Issue: 10/05/2019

Page: 82

7.2 xp_sat_nominal_att_init_model

7.2.1 Overview

The **xp_sat_nominal_att_init_model** CFI function initialises the satellite nominal attitude model for a given satellite. The initialised model will be stored in the *sat nom trans id* output structure.

7.2.2 Calling Interface

The calling interface of the **xp_sat_nominal_att_init_model** CFI function is the following (input parameters are <u>underlined</u>):

The XP_NUM_ERR_SAT_NOM_ATT_INIT_MODEL and XP_NUM_MODEL_PARAM constants are defined in the file *explorer pointing.h*.

Date:

Issue: 10/05/2019

Page: 83

7.2.3 Input Parameters

The xp_sat_nominal_att_init_model CFI function has the following input parameters:

Table 8: Input parameters of xp_sat_nominal_att_init_model function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
model_enum	long *	-	Sat Nom Attitude Model ID	-	Complete
model_param	double	-	Model dependant parameters	-	Complete

It is possible to use enumeration values rather than integer values for some of the input arguments:

- Satellite Nominal Attitude Model ID: model_enum. See current document, Table 3.
- Model dependant parameters: model param. See current document, Table 9.

Table 9: Model parameters depending on the attitude model

Attitude Model	Array Element	Description (Reference)	Unit (Format)
XP_MODEL_GENERIC	[0]	First Axis enumeration value	-
	[1]	First Target enumeration value	-
	[2]	First Vector[0]	- or deg
	[3]	First Vector[1]	- or deg
	[4]	First Vector[2]	- or deg
	[5]	Second Axis enumeration value	
	[6]	Second Target enumeration value	
	[7]	Second Vector[0]	- or deg
	[8]	Second Vector[1]	- or deg
	[9]	Second Vector[2]	- or deg
XP_MODEL_ENVISAT	[0]	AOCS Cx parameter [pitch]	deg
	[1]	AOCS Cy parameter [roll]	deg
	[2]	AOCS Cz parameter [yaw]	deg
XP_MODEL_CRYOSAT	[0]	Local Normal Z Coefficient	-
XP_MODEL_ADM	[0]	Scan Angle	deg
	[1]	Scan Limit	deg
	[2]	Velocity Offset	m/s
XP_MODEL_SENTINEL1 [0] Local Normal Coefficient		Local Normal Coefficient	-
	[1]	Earth's angular velocity vector	rad/s
	[2]	Antenna bore sight off nadir angle at reference altitude (Θ_{ref})	deg

Date:

Issue: 10/05/2019

Page: 84

	[3]	Reference altitude (H _{ref})	km
	[4]	Roll steering sensitivity versus altitude (α_{roll})	deg/km
	[5]	h_0	m
	[6]	h ₁	m
	[7]	h ₂	m
	[8]	h ₃	m
	[9]	h_4	m
	[10]	$ \phi_1 $	rad
	[11]	$ \phi_2 $	rad
	[12]	$ \phi_3 $	rad
	[13]	$ \phi_4 $	rad
XP_MODEL_SENTINEL2	[0]	Earth's angular velocity vector	rad/s
XP_MODEL_GEO	[0]	Flag (enumeration values can be used): XP_AUTOMATIC_FLIP_MODE = enable the automatic Yaw Flip XP_WINTER_MODE = Winter XP_SUMMER_MODE = Summer	-
XP_MODEL_METOPSG	[0]	Local Normal Coefficient	-
	[1]	Earth's angular velocity vector	rad/s

7.2.3.1 Generic Model description

The generic model builds the reference frames from the specified direction vectors.

The model parameters are:

- first_axis: It can be any of {XP_X_AXIS, XP_NEG_X_AXIS, XP_Y_AXIS, XP_NEG_Y_AXIS, XP_Z_AXIS, XP_NEG_Z_AXIS}
- first_target: It can be any of {XP_SUN_VEC, XP_MOON_VEC, XP_EARTH_VEC, XP_NADIR_VEC, XP_INERTIAL_VEL_VEC, XP_EF_VEL_VEC, XP_INERTIAL_TARGET_VEC, XP_EF_TARGET_VEC, XP_SC_EF_VEL_VEC, XP_ORBIT_POLE, XP_INERTIAL_POS_VEC_CORRECTED, XP_INERTIAL_VEL_VEC ROTATED, XP_EF_NORTH, XP_EF_SOUTH}
- first_vector[3]: contains either:
 - dummies
 - [long, lat, alt] if first target = XP_EF_TARGET_VEC
 - [ra, decl, parallax] if first target = XP INERTIAL TARGET VEC
 - correction coefficients if first target = XP INERTIAL POS VEC CORRECTED
 - rotation vector if first target = XP INERTIAL VEL VEC ROTATED

Date:

Issue: 10/05/2019

Page: 85

second_axis: It can be any of {XP_X_AXIS, XP_NEG_X_AXIS, XP_Y_AXIS, XP_NEG_Y_AXIS,XP_Z_AXIS,XP_NEG_Z_AXIS}

second_target: It can be any of {XP_SUN_VEC, XP_MOON_VEC, XP_EARTH_VEC, XP_NADIR_VEC, XP_INERTIAL_VEL_VEC, XP_EF_VEL_VEC, XP_INERTIAL_TARGET_VEC, XP_EF_TARGET_VEC, XP_SC_EF_VEL_VEC, XP_ORBIT_POLE, XP_INERTIAL_POS_VEC_CORRECTED, XP_INERTIAL_VEL_VEC_ROTATED, XP_EF_NORTH, XP_EF_SOUTH}

- second_vector[3]: contains either:
 - dummies
 - [long, lat, alt] if second target= XP_EF_TARGET_VEC
 - [ra, decl, parallax] if fsecond target=XP INERTIAL TARGET VEC
 - correction coefficients if second target=XP INERTIAL POS VEC CORRECTED
 - rotation vector if second target = XP_INERTIAL_VEL_VEC_ROTATED

It is necessary to define a convention for each target type (e.g., always from Satellite to XXX):

- XP SUN VEC: Unit direction vector from Satellite to Sun
- XP_MOON_VEC: Unit direction vector from Satellite to Moon
- XP_EARTH_VEC: Unit direction vector from Satellite to Earth centre (opposite to Satellite Position Vector)
- XP_NADIR_VEC: Unit direction vector from Satellite to Nadir point
- XP_INERTIAL_VEL_VEC: Inertial Velocity vector (in TOD)
- XP_EF_VEL_VEC: Earth Fixed Velocity vector
- XP_INERTIAL_TARGET_VEC: Unit direction vector from Satellite to a target defined by a given [ra, decl, parallax]. The annual parallax is used in case we are pointing to a close object (for instance, the Moon), in order to get the distance. For stars, parallax=0 shall be used, meaning infinite distance. Units: degrees
- XP_EF_TARGET_VEC: Unit direction vector from Satellite to a target defined by a given [long, lat, alt]
- XP SC EF VEL VEC: Satellite Earth Fixed Velocity vector
- XP_ORBIT_POLE: Unit direction vector normal to the orbital plane (computed as the cross product of the Satellite Position vector and its Velocity vector)
- XP_INERTIAL_POS_VEC_CORRECTED: Unit Satellite position vector in ToD corrected by coefficients (e.g to approximate the local normal direction)
- XP_INERTIAL_VEL_VEC_ROTATED: Inertial Velocity vector in ToD rotated (e.g correcting for the Earth rotation)
- XP EF NORTH: Unit direction vector pointing North (in Earth Fixed)
- XP_EF_SOUTH: Unit direction vector pointing South (in Earth Fixed)

With these parameters, the calculation is done as follows:

- Compute the unit direction vector specified by first target
 - Assign the calculated first target vector to the first axis vector
- Compute the unit direction vector specified by second_target
 - Cross-product of the first axis vector and the second target vector
 - Assign the resulting vector to the second axis vector
 - Complete the right-handed frame

Date:

Issue: 10/05/20 197

Page: 86

The following are some examples:

Sun-Fixed Reference Frame

• $model_param = \{XP_X_AXIS, XP_SUN_VEC, 0.0, 0.0, 0.0, XP_Z_AXIS, XP_EARTH_VEC, 0.0, 0.0, 0.0\}$

Then:

- X-axis = Unit vector from Satellite to Sun (Sun Vector)
- Z-axis = Unit cross product: X-axis x (Unit vector from Satellite to Earth (Earth Vector))
- Y-axis = Z-axis x X-axis (completing the right-handed frame)

Yaw Steering Mode

- model_param={XP_NEG_Z_AXIS, XP_NADIR_VEC, 0.0, 0.0, 0.0, XP_X_AXIS, XP_SC_EF_VEL_VEC, 0.0, 0.0, 0.0}
 Then:
- Z-axis = -(Unit vector from Satellite to Nadir (Nadir Vector))
- X-axis = Unit cross product: Z-axis x (Satellite Earth-Fixed Velocity Vector)
- Y-axis = Z-axis x X-axis (completing the right-handed frame)

7.2.3.2 <u>Sentinel-1 Model parameters description</u>

The parameters for the Sentinel-1 attitude model corresponds to the roll steering law:

$$\theta_{\text{offNadir}} = \theta_{\text{ref}} - \alpha_{\text{roll}} (H - H_{\text{ref}})$$

where the actual altitude of the satellite is approximated by the harmonic function:

$$H(t) = h_0 + \sum_{n=1}^{N} h_n \cdot \sin(n \cdot \omega_{orb} \cdot (t - t_{ANX}) + \phi_n)$$

The first fourth terms of the series are considered.

Consult [MSC] for more information.

7.2.3.3 Sentinel-2 Model description

Sentinel 2 model is implemented as generic model with the following definitions:

- First axis: XP NEG Z AXIS; first target = XP EARTH VEC.
- Second axis: XP_X_AXIS; second target = XP_INERTIAL_VEL_VEC_ROTATED

7.2.3.4 Yaw flip attitude Model description

Yaw Flip model is implemented as generic model with the following definitions:

- 1. For WINTER mode:
 - First axis: XP NEG Z AXIS; first target = XP NADIR VEC.
 - Second axis: XP X AXIS; second target = XP EF SOUTH
- 2. For SUMMER mode:
 - First axis: XP NEG Z AXIS; first target = XP NADIR VEC.
 - Second axis: XP X AXIS; second target = XP EF NORTH

Date:

Issue: 10/05/20 197

Page: 87

3. For AUTOMATIC Yaw Flip, the attitude is set to WINTER or SUMMER mode depending on the Sun position: if the Sun position is above the equatorial plane, SUMMER mode is selected; if the Sun position is below the equatorial plane, WINTER mode is selected.

7.2.3.5 MetOp-SG Model description

MetOp-SG model is identical to the ideal YSM law with the following definitions:

- The Z axis that is computed with an approximation for the local normal vector using an altitude dependent correction factor.
- The input parameters are the local normal coefficient and the Earth's rotation speed.
- First axis: XP Z AXIS; first target = XP INERTIAL POS VEC CORRECTED
- Second axis: XP X AXIS; second target = XP INERTIAL VEL VEC ROTATED

7.2.4 Output Parameters

The output parameters of the **xp_nominal_att_init_model** CFI function are:

Table 10: Output parameters of xp_sat_nominal_att_init_model

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_nom_trans_id	xp_sat_nom _trans_id*	-	Structure that contains the Satellite nominal Transformation	-	-
ierr	long	-	Error vector	-	-

7.2.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_sat_nominal_att_init_model** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_sat_nominal_att_init_model** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM])

Table 11: Error messages of xp_sat_nominal_att_init_model function

Error type	Error message	Cause and impact	Error code	Error No
ERR	Memory allocation error	No calculation performed	XP_CFI_SAT_NOMINAL_ATT_ INIT_MODEL_MEMORY_ERR	0

7.3 xp_sat_nominal_att_init_harmonic

7.3.1 Overview

The **xp_sat_nominal_init_harmonic** CFI function initialises the satellite orbital to satellite nominal attitude mispointing angles (i.e. roll, pitch, yaw) for a given satellite with a user-provided set of values. The initialised values will be stored in the *sat nom trans id* output structure.

The mispointing angle (attitude angle in the formula) will be calculated by functions using such sat_nominal_trans_id (i.e. xp_attitude_compute or xp_change_frame) according to the following formula (the "angle" variable will be calculated as in xl position on orbit (see [LIB SUM]), using as inputs:

- the input state vector in EF passed to such functions;
- the angle_type passed as input to xp_sat_nominal_att_init_harmonic.

7.3.2 Calling Interface

The calling interface of the **xp_sat_nominal_att_init_harmonic** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>
    long angle type, num terms[3];
    long harmonic type pitch [XP MAX NUM HARMONIC],
         harmonic type roll[XP MAX NUM HARMONIC],
         harmonic type yaw[XP MAX NUM HARMONIC];
    double harmonic coef pitch[XP MAX NUM HARMONIC],
        harmonic coef roll[XP MAX NUM HARMONIC],
        harmonic coef yaw[XP MAX NUM HARMONIC];
    xp sat nom trans id sat nom trans id = {NULL};
    long ierr[XP NUM ERR SAT NOM ATT INIT HARMONIC], status;
                 xp sat nominal att init harmonic (& angle type,
    status =
                                    num terms,
                                    harmonic type pitch,
                                    harmonic type roll,
                                    harmonic type yaw,
                                    harmonic coef pitch,
                                    harmonic coef roll,
                                    harmonic coef yaw,
                                    &sat nom trans id,
                                    ierr);
```

Date:

Issue: 10/05/2019

Page: 90

}

The $XP_NUM_ERR_SAT_NOM_ATT_INIT_HARMONIC$ and $XP_MAX_NUM_HARMONIC$ constants are defined in the file $explorer_pointing.h.$

Date:

Issue: 10/05/2019

Page: 91

7.3.3 Input Parameters

The xp_sat_nominal_att_init_harmonic CFI function has the following input parameters:

Table 12: Input parameters of xp_sat_nominal_att_init_harmonic function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
angle_type	long *	-	Type of angle	-	XP_ANGLE_TYP E_TRUE_LAT_T OD XP_ANGLE_TYP E_TRUE_LAT_EF
num_terms[3]	long	[0]	Number of elements used in vectors harmonic_type_pitch and harmonic_coef_pitch	-	>=0
		[1]	Number of elements used in vectors harmonic_type_roll and harmonic_coef_roll	-	>=0
		[2]	Number of elements used in vectors harmonic_type_yaw and harmonic_coef_yaw	-	>=0
harmonic_type _pitch	long[XP_MA X_NUM_HA RMONIC]	all	Type of coefficients: =0 for the bias parameter <0 for the sinus coefficients (-n means that correponds to the sinus coefficient of order n) >0 for the cosinus coefficients (+n means that correponds to the cosinus coefficient of order n)		
harmonic_type _roll	long[XP_MA X_NUM_HA RMONIC]	all	Type of coefficients: =0 for the bias parameter <0 for the sinus coefficients (-n means that correponds to the sinus coefficient of order n) >0 for the cosinus coefficients (+n means that correponds to the cosinus coefficient of order n)	-	-
harmonic_type _yaw	long[XP_MA X_NUM_HA RMONIC]	all	Type of coefficients: =0 for the bias parameter <0 for the sinus coefficients (-n means that correponds to the sinus coefficient of order n) >0 for the cosinus coefficients (+n means that correponds to	-	_

Date:

Issue: 10/05/2019

Page: 92

			the cosinus coefficient of order n)		
harmonic_coef _pitch	dou ble[XP_MA X_NUM_HA RMONIC]	all	Bias, sinus and cosinus coefi cients for the pitch angle	deg	-
harmonic_coef _roll	dou ble[XP_MA X_NUM_HA RMONIC]	all	Bias, sinus and cosinus coefi cients for the roll angle	deg	-
harmonic_coef _yaw	dou ble[XP_MA X_NUM_HA RMONIC]	all	Bias, sinus and cosinus coefi cients for the yaw angle	deg	-

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Angle Type: See current document, Table 3.

7.3.4 Output Parameters

The output parameters of the xp_sat_nominal_att_init_harmonic CFI function are:

Table 13: Output parameters of xp_sat_nominal_att_init_harmonic

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_nom_trans_id	xp_sat_nom _trans_id*	-	Structure that contains the Satellite nominal Transformation	-	-
ierr	long	-	Error vector	-	-

7.3.5 Example

```
For the satellite ERS:
pitch = -0.16725*cos(true_lat)*sin(true_lat)*2=-0.16725*sin(2*true_lat)
num_terms[0]=1
harmonic_type_pitch={-2} harmonic_coef_pitch={-0.16725}

roll = 0.05012*sin(true_lat)
num_terms[1]=1
harmonic_type_roll={-1} harmonic_coef_roll={0.05012}

yaw= 3.9163*cos(true_lat)
num_terms[2]=1
```

Date:

Issue: 10/05/2019

Page: 93

harmonic type yaw={+1} harmonic coef yaw={3.9163}

7.3.6 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_sat_nominal_att_init_harmonic** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_sat_nominal_att_init_harmonic** function by calling the function of the EO POINTING software library **xp get code** (see [GEN SUM])

Table 14: Error messages of xp_sat_nominal_att_init_harmonic function

ERR	Memory allocation error	No calculation performed	XP_CFI_SAT_NOMINAL_ATT_ INIT_HARMONIC_MEMORY_E RR	0

Date:

Issue: 10/05/2019

Page: 94

7.4 xp_sat_nominal_att_init_file

7.4.1 Overview

The **xp_sat_nominal_att_init_file** CFI function initialises the satellite nominal attitude angles for a given satellite reading values from the attitude file(s). The validity time or orbital range for the attitude angles can be specified by the user. The initialised values will be stored in the *sat nom trans id* output structure.

In order to read files, xp_sat_nominal_att_init_file function internally uses Data Handling functions. Please refer to [D H SUM], in particular sections 4.2 and 4.3, for further details.

7.4.2 Calling Interface

The calling interface of the **xp_sat_nominal_att_init_file** CFI function is the following (input parameters are <u>underlined</u>):

The XP NUM ERR SAT NOM ATT INIT FILE constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 95

7.4.3 Input Parameters

The xp_sat_nominal_att_init_file CFI function has the following input parameters:

Table 15: Input parameters of xp_sat_nominal_att_init_file function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
time_id	xl_time_id*	-	Structure that contains the time correlations.	-	-
n_files	long *	-	Number of reference data files	-	> 0
attitude_file	char **	-	Filenames of the reference data files. In case multiple files are used, the files should be time ordered. The supported Attitude File format is the Generic Attitude File as described in Error: Reference source not found.	-	-
time_init_mode	long *	-	Flag for selecting the time range of the initialization.	-	Select either: · XP_SEL_TIME · XP_SEL_FILE
time_ref	long *	-	Time reference ID	-	Complete
time0	double*	-	If:time_init_mode=XP_SEL_TIME S Start of the time range defined by[time0,time1]	Decimal days (Process ing format)	[-18262.0,36524.0]
time1	double*	-	If: time_init_mode=XP_SEL_TIME End of the time range defined by [time0,time1]	Decimal days (Process ing format)	[-18262.0,36524.0] > time0

It is possible to use enumeration values rather than integer values for some of the input arguments:

- Time Reference ID: time ref. See [GEN SUM].
- Time Init Mode ID: time init mode. See current document, Table 3.

Date:

Issue: 10/05/2019

Page: 96

7.4.4 Output Parameters

The output parameters of the xp_sat_nominal_att_init_file CFI function are:

Table 16: Output parameters of xp_sat_nominal_att_init_file

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
val_time0	double*	-	Validity start time of the initialization	Decimal days (Processing format)	[-18262.0,36524.0]
val_time1	double*	-	Validity end time of the initialization	Decimal days (Processing format)	[-18262.0,36524.0]
sat_nom_trans_id	xp_sat_nom _trans_id*	-	Structure that contains the Satellite nominal Transformation	-	-
ierr	long	-	Error vector	-	-

7.4.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_sat_nominal_att_init_file** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_sat_nominal_att_init_file** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 17: Error messages of xp_sat_nominal_att_init_file function

7.5 xp_sat_nominal_att_close

7.5.1 Overview

The **xp_sat_nominal_att_close** CFI function cleans up any memory allocation performed by the satellite nominal attitude initialization functions.

7.5.2 Calling Interface

The calling interface of the **xp_sat_nominal_att_close** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    xp_sat_nom_trans_id sat_nom_trans_id = {NULL};
    long ierr[XP_NUM_ERR_SAT_NOM_ATT_CLOSE], status;

    status = xp_sat_nominal_att_close(&sat_nom_trans_id, ierr);
}
```

The XP NUM ERR SAT NOM ATT CLOSE constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/20 197

Page: 99

7.5.3 Input Parameters

The xp_sat_nominal_att_close CFI function has the following input parameters:

Table 18: Input parameters of xp_sat_nominal_att_close function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_nom_trans_id	xp_sat_nom _trans_id*	-	Structure that contains the Satellite Nom. Trans.	-	-

7.5.4 Output Parameters

The output parameters of the **xp** sat **nominal** att close CFI function are:

Table 19: Output parameters of xp_sat_nominal_att_close

C name	C type	Array Element	Description (Reference)	_	
ierr	long	-	Error vector	-	-

7.5.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_sat_nominal_att_close** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_sat_nominal_att_close** function by calling the function of the EO POINTING software library **xp_get_code** (see [GEN SUM]).

7.10.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

- The sat_nom_trans_id was not initialised.
- The sat_nom_trans_id initialization does not allow the use of this function.

7.12.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

- The sat_nom_trans_id was not initialised.
- The sat_nom_trans_id initialization does not allow the use of this function.

Date:

Issue: 10/05/2019

Page: 114

7.13 xp_sat_nominal_att_set_file

7.13.1 Overview

The **xp_sat_nominal_att_set_file** CFI function changes the initialization data for the satellite nominal attitude Id, when it was initialised with a file.

If quaternions are introduced, it is checked that they are normalized.

7.13.2 Calling interface

The calling interface of the **xp_sat_nominal_att_set_file** CFI function is the following (input parameters are <u>underlined</u>):

7.13.3 Input parameters

The **xp_sat_nominal_att_set_file** CFI function has the following input parameters:

Table 35: Input parameters of xp_sat_nominal_att_set_file function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_nom_tr ans_id	xp_sat_nom_tran s_id *	-	Satellite nominal transformation ID (input / output parameter)	-	-
data	xp_file_model_str	-	Attitude initialization data	-	-

7.13.4 Output parameters

The output parameters of the xp sat nominal att set file CFI function are:

Date:

Issue: 10/05/2019

Page: 115

Table 36: Output parameters of xp_sat_nominal_att_set_file function

7.14 xp_sat_att_angle_init

7.14.1 Overview

The **xp_sat_att_angle_init** CFI function initialises the satellite nominal attitude to satellite attitude mispointing angles for a given satellite with a user-provided set of values. The initialised values will be stored in the *sat trans id* output structure.

7.14.2 Calling Interface

The calling interface of the **xp_sat_att_angle_init** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    double ang[3];
    xp_sat_trans_id sat_trans_id = {NULL};
    long ierr[XP_NUM_ERR_MISP_ANGLE_INIT_DEF], status;
    status = xp_sat_att_angle_init(ang, &sat_trans_id, ierr);
}
```

The XP NUM ERR SAT ATT ANGLE INIT constant is defined in the file explorer_pointing.h.

Date:

Issue: 10/05/20 197

Page: 117

7.14.3 Input Parameters

The **xp_sat_att_angle_init** CFI function has the following input parameters:

Table 37: Input parameters of xp_sat_att_angle_init function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
ang	double[3]	[0]	Pitch mispointing angle (Satellite Nominal Attitude Frame)	deg	If no better value, assume 0.0
		[1]	Roll mispointing angle (Satellite Nominal Attitude Frame)	deg	If no better value, assume 0.0
		[2]	Yaw mispointing angle (Satellite Nominal Attitude Frame)	deg	If no better value, assume 0.0

7.14.4 Output Parameters

The output parameters of the xp sat att angle init CFI function are:

Table 38: Output parameters of xp_sat_att_angle_init

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_trans_id	xp_sat_trans _id*	-	Structure that contains the Satellite Transformation	-	-

7.15 xp_sat_att_matrix_init

7.15.1 Overview

The **xp_sat_att_matrix_init** CFI function initializes misalignment matrix between the satellite nominal attitude frame and satellite attitude frame with a user-provided matrix. The initialized values will be stored in the *sat trans id* output structure. It is checked that the input matrix is orthonormal.

Note on matrix notation:

If XYZ are the axes of the original reference frame, and X'Y'Z' are the axes of the rotated frame, the rows of the rotation matrix are respectively X, Y and Z axes expressed in X'Y'Z' system.

In the C representation, M[0][], M[1][], M[2][] are respectively 1st, and and 3rd row of a rotation matrix M.

The rotation matrix M satisfies the following equivalence:

$$V = M*V$$

where V' is a vector expressed in the X'Y'Z' reference system and V is expressed in the XYZ reference system.

7.15.2 Calling Interface

The calling interface of the **xp_sat_att_matrix_init** CFI function is the following (input parameters are underlined):

The XP NUM ERR SAT ATT MATRIX INIT constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

7.16 xp_sat_att_init_harmonic

7.16.1 Overview

The **xp_sat_att_init_harmonic** CFI function initialises the satellite nominal orbital to satellite attitude mispointing angles (i.e. roll, pitch, yaw) for a given satellite with a user-provided set of values. The initialised values will be stored in the *sat trans id* output structure.

The mispointing angle (attitude angle in the formula) will be calculated by functions using such sat_trans_id (i.e. xp_attitude_compute or xp_change_frame) according to the following formula (the "angle" variable will be calculated as in xl position on orbit (see [LIB SUM]), using as inputs:

- the input state vector in EF passed to such functions;
- the angle_type passed as input to xp_sat_att_init_harmonic.

7.16.2 Calling Interface

The calling interface of the **xp_sat_att_init_harmonic** CFI function is the following (input parameters are underlined):

```
#include <explorer pointing.h>
    long angle type, num_terms[3];
    long harmonic type pitch [XP MAX NUM HARMONIC],
         harmonic type roll[XP MAX NUM HARMONIC],
         harmonic type yaw[XP MAX NUM HARMONIC];
    double harmonic coef pitch[XP MAX NUM HARMONIC],
        harmonic coef roll[XP MAX NUM HARMONIC],
        harmonic coef yaw[XP MAX NUM HARMONIC];
    xp sat trans id sat trans id = {NULL};
    long ierr[XP NUM ERR SAT ATT INIT HARMONIC], status;
    status = xp sat att init harmonic (&angle type, num terms,
                                    harmonic type pitch,
                                    harmonic type roll,
                                    harmonic type yaw,
                                    harmonic coef pitch,
                                    harmonic coef roll,
                                    harmonic coef yaw,
                                    &sat trans id, ierr);
```

7.17xp_sat_att_init_file

7.17.1 Overview

The **xp_sat_att_init_file** CFI function initialises the satellite attitude angles for a given satellite reading values from the attitude file(s). The validity time or orbital range for the attitude angles can be specified by the user. The initialised values will be stored in the *sat_trans_id* output structure. The quaternions that could be read from the file are checked to be normalized.

In order to read files, xp_sat_att_init_file function internally uses Data Handling functions. Please refer to [D H SUM], in particular sections 4.2 and 4.3, for further details.

7.17.2 Calling Interface

The calling interface of the **xp_sat_att_init_file** CFI function is the following (input parameters are <u>underlined</u>):

The XP NUM ERR SAT ATT INIT FILE constant is defined in the file explorer_pointing.h.

Date:

Issue: 10/05/2<u>0</u>19

Page: 128

7.17.3 Input Parameters

The **xp_sat_att_init_file** CFI function has the following input parameters:

Table 46: Input parameters of xp_sat_att_init_file function

C name	C type	Array	Description (Reference)	Unit	Allowed Range
		Element		(Format)	
time_id	xl_time_id*	-	Structure that contains the time correlations.	-	-
n_files	long *	-	Number of reference data files	-	> 0
attitude_file	char **	-	Filenames of the reference data files. In case multiple files are used, the files should be time ordered. The supported Attitude File for mats are the Generic Attitude File (described in [D_H_SUM]Error: Reference source not found) and Star Tracker files. If multiple files are used, Generic Attitude Files and Star Tracker files	-	-
			cannot be given to the func tion as part of the same list.		
			When using Star-Tracker files, the function assumes that all the input files belong to the same Star-Tracker. As a consequence of this assumption only the Star-Tracker identifier of the first file provided in the list is read. Note that the Star-Tracker identification number should be either 1, 2 or 3 (no internal check is performed)		
auxiliary_file	char **	-	Filename of an auxiliary file con taining the Star-Tracker misaligne ment matrices	-	-
time_init_mode	long *	-	Flag for selecting the time range of the initialization.	_	Select either: · XP_SEL_TIME · XP_SEL_FILE
time_ref	long *	-	Time reference ID	-	Complete
time0	double*	-	If: time_init_mode=XP_SEL_TIME Start of the time range defined by [time0,time1]	Decimal days (Process ing format)	[-18262.0,36524.0]
time1	double*	-	If: time_init_mode=XP_SEL_TIME End of the time range defined by	Decimal days	[-18262.0,36524.0] > time0

Date:

Issue: 10/05/2019

Page: 129

		[time0,time1]	(Process ing format)
			ing format)

It is possible to use enumeration values rather than integer values for some of the input arguments:

- Time Reference ID: time ref. See [GEN SUM].
- Time Init Mode ID: time init mode. See current document, Table 3.

7.17.4 Output Parameters

The output parameters of the **xp** sat att init file CFI function are:

Table 47: Output parameters of xp_sat_att_init_file

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
val_time0	double*	-	Validity start time of the initialization	Decimal days (Processing format)	[-18262.0,36524.0]
val_time1	double*	-	Validity end time of the initialization	Decimal days (Processing format)	[-18262.0,36524.0]
sat_trans_id	xp_sat_trans _id*	-	Structure that contains the Satellite Transformation	-	-
ierr	long	-	Error vector	-	-

7.17.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_sat_att_init_file** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_sat_att_init_file** function by calling the function of the EO_POINTING software library **xp get code** (see [GEN_SUM]).

Table 48: Error messages of xp_sat_att_init_file function

7.18 xp_sat_att_quat_plus_matrix_init

7.18.1 Overview

The **xp_sat_att_quat_plus_matrix_init** CFI function initialises the satellite attitude angles using the input quaternions, and stores the rotation matrix from the satellite-based reference frame defined by the quaternions to the satellite frame, that must be provided by the user. The initialised values will be stored in the *sat_trans_id* output structure. The input quaternions are checked to be normalized, and the input matrix is checked to be orthonormal.

Note on matrix notation:

If XYZ are the axes of the original reference frame, and X'Y'Z' are the axes of the rotated frame, the rows of the rotation matrix are respectively X, Y and Z axes expressed in X'Y'Z' system.

In the C representation, M[0][], M[1][], M[2][] are respectively 1st, and and 3rd row of a rotation matrix M.

The rotation matrix M satisfies the following equivalence:

$$V = M*V$$

where V' is a vector expressed in the X'Y'Z' reference system and V is expressed in the XYZ reference system.

7.18.2 Calling Interface

The calling interface of the **xp_sat_att_quat_plus_matrix_init** CFI function is the following (input parameters are <u>underlined</u>):

The XP_NUM_ERR_SAT_ATT_QUAT_PLUS_MATRIX_INIT constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 132

7.18.3 Input Parameters

The **xp_sat_att_init_file** CFI function has the following input parameters:

Table 49: Input parameters of xp_sat_att_quat_plus_matrix_init function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
inertial_frame	long*	-	Inertial reference frame.	-	Defined in XD_Cs_enum
num_rec	long *	-	Number of quaternions	-	> 0
quaternions	xd_att_rec	-	Quaternions that give the rotation from the inertial reference frame to the frame based on the satellite.	-	-
matrix	double**	-	Rotation matrix from the frame based on the satellite to the satel lite frame.	-	-

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Inertial frame. See [D H SUM].

7.18.4 Output Parameters

The output parameters of the **xp** sat att init file CFI function are:

Table 50: Output parameters of xp_sat_att_quat_plus_matrix_init

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_trans_id	xp_sat_trans _id*	-	Structure that contains the Satellite Transformation	-	-
ierr	long	-	Error vector	-	-

7.18.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_sat_att_quat_plus_matrix_init** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

Date:

Issue: 10/05/2019

Page: 133

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_sat_att_quat_plus_matrix_init** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 51: Error messages of xp_sat_att_quat_plus_matrix_init function

Error type	Error message	Cause and impact	Error code	Error No
ERR	Memory allocation error	No calculation performed	XP_CFI_SAT_ATT_QUAT_PL US_MATRIX_INIT_MEMORY_ ERR	0
ERR	Quaternion is not normalized	No calculation performed	XP_CFI_SAT_ATT_QUAT_PLU S_MATRIX_INIT_QUAT_UNITA RY_ERR	1
ERR	Matrix is not orthonormal	No calculation performed. The CFI performs a check, with a tolerance of 10 ⁻⁶ , that the product of the input matrix and its transposed is the unitary matrix.	XP_CFI_SAT_ATT_QUAT_PLU S_MATRIX_INIT_MATRIX_ORT HONORMAL_ERR	

Date:

Issue: 10/05/2019

Page: 134

7.19 xp_sat_att_quat_plus_angle_init

7.19.1 Overview

The **xp_sat_att_quat_plus_angle_init** CFI function initialises the satellite attitude angles using the input quaternions, and stores the rotation matrix from the satellite-based reference frame defined by the quaternions to the satellite frame, calculated with the input angles. The initialised values will be stored in the *sat trans id* output structure. The input quaternions are checked to be normalized.

7.19.2 Calling Interface

The calling interface of the **xp_sat_att_quat_plus_angle_init** CFI function is the following (input parameters are <u>underlined</u>):

The XP_NUM_ERR_SAT_ATT_QUAT_PLUS_ANGLE_INIT constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 135

7.19.3 Input Parameters

The xp_sat_att_quat_plus_angle_init CFI function has the following input parameters:

Table 52: Input parameters of xp_sat_att_quat_plus_matrix_init function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
inertial_frame	long*	-	Inertial reference frame.	-	Defined in XD_Cs_enum
num_rec	long *	-	Number of quaternions	-	> 0
quaternions	xd_att_rec *	-	Quaternions that give the rotation from the inertial reference frame to the frame based on the satellite.	-	-
angles	double[3]	-	Angles that define the rotation from the frame based on the satellite to the satellite frame.	-	-

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Inertial frame. See [D H SUM].

7.19.4 Output Parameters

The output parameters of the xp sat att quat plus angle init CFI function are:

Table 53: Output parameters of xp_sat_att_quat_plus_angle_init

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_trans_id	xp_sat_trans _id*	-	Structure that contains the Satellite Transformation	-	-
ierr	long	-	Error vector	-	-

7.19.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_sat_att_quat_plus_angle_init** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

Date:

Issue: 10/05/2019

Page: 136

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_sat_att_quat_plus_angle_init** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 54: Error messages of xp_sat_att_quat_plus_angle_init function

Error type	Error message	Cause and impact	Error code	Error No
ERR	Memory allocation error	No calculation performed	XP_CFI_SAT_ATT_QUAT_PL US_ANGLE_INIT_MEMORY_E RR	0
ERR	Error calculating rotation matrix for eurler angles	No calculation performed	XP_CFI_SAT_ATT_QUAT_PL US_ANGLE_EULER_TO_MAT RIX_ERR	1
ERR	Quaternion is not normalized	No calculation performed The CFI performs a check, with a tolerance of 10 ⁻⁶ , that the product of the input matrix and its transposed is the unitary matrix.	XP_SAT_ATT_QUAT_PLUS_A NGLE_INIT_QUAT_UNITARY_ ERR	2

7.20 xp_sat_att_close

7.20.1 Overview

The **xp_sat_att_close** CFI function cleans up any memory allocation performed by the satellite attitude initialization functions.

7.20.2 Calling Interface

The calling interface of the **xp_sat_att_close** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    xp_sat_trans_id sat_trans_id = {NULL};
    long ierr[XP_NUM_ERR_SAT_ATT_CLOSE], status;
    status = xp_sat_att_close(&sat_trans_id, ierr);
}
```

The XP NUM ERR SAT ATT CLOSE constant is defined in the file explorer_pointing.h.

Date:

Issue: 10/05/20 197

Page: 138

7.20.3 Input Parameters

The xp_sat_att_close CFI function has the following input parameters:

Table 55: Input parameters of xp_sat_att_close function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_trans_id	xp_sat_trans _id*	-	Structure that contains the Sat. Trans.	-	-

7.20.4 Output Parameters

The output parameters of the xp sat att close CFI function are:

Table 56: Output parameters of xp_sat_att_close

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
ierr	long	-	Error vector	-	-

7.20.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_sat_att_close** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_sat_att_close** function by calling the function of the EO_POINTING software library **xp get code** (see [GEN SUM]).

Table 57: Error messages of xp_sat_att_close function

Error type	Error message	Cause and impact	Error code	Error No
ERR	Could not close the ld. as it is not initialized or it is being used	No calculation performed	XP_CFI_SAT_ATT_CLOSE_W RONG_ID_ERR	0

7.21 xp_sat_att_get_angles

7.21.1 Overview

The xp_sat_att_get_angles CFI function returns angle data used for the satellite attitude initialization.

7.21.2 Calling interface

The calling interface of the **xp_sat_att_get_angles** CFI function is the following (input parameters are <u>underlined</u>):

7.21.3 Input parameters

The xp_sat_att_get_angles CFI function has the following input parameters:

Table 58: Input parameters of xp_sat_att_get_angles function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_trans_id	xp_sat_trans_id *	-	Satellite transformation ID.	-	-

7.21.4 Output parameters

The output parameters of the xp sat att get angles CFI function are:

Table 59: Output parameters of xp_sat_att_get_angles function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xp_sat_att_get_angl	long	-	Status flag	-	-
data	xp_angle_model _str	-	Attitude initialization data	-	-

Date:

Issue: 10/05/2019

Page: 141

7.21.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

- The sat trans id was not initialised.
- The sat trans id initialization does not allow the use of this function.

Date:

Issue: 10/05/20 197

Page: 142

7.22 xp_sat_att_set_angles

7.22.1 Overview

The **xp_sat_att_set_angles** CFI function changes the harmonic data used for the satellite attitude initialization.

7.22.2 Calling interface

The calling interface of the **xp_sat_att_set_angles** CFI function is the following (input parameters are <u>underlined</u>):

7.22.3 Input parameters

The xp_sat_att_set_angles CFI function has the following input parameters:

Table 60: Input parameters of xp_sat_att_set_angles function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_trans_id	xp_sat_trans_i d *	-	Satellite transformation ID (input / output parameter)	-	-
data	xp_angle_mod el_str	-	Attitude initialization data	-	-

7.22.4 Output parameters

The output parameters of the xp_sat_att_set_angles CFI function are:

Table 61: Output parameters of xp_sat_att_set_angles function

7.22.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

- The sat_trans_id was not initialised.
- The sat_trans_id initialization does not allow the use of this function.

Date:

Issue: 10/05/20 197

Page: 144

7.23 xp_sat_att_get_matrix

7.23.1 Overview

The xp_sat_att_get_matrix CFI function returns the matrix data used for the satellite attitude initialization.

Note on matrix notation:

If XYZ are the axes of the original reference frame, and X'Y'Z' are the axes of the rotated frame, the rows of the rotation matrix are respectively X, Y and Z axes expressed in X'Y'Z' system.

In the C representation, M[0][], M[1][], M[2][] are respectively 1st, and and 3rd row of a rotation matrix M.

The rotation matrix M satisfies the following equivalence:

$$V = M*V$$

where V' is a vector expressed in the X'Y'Z' reference system and V is expressed in the XYZ reference system.

7.23.2 Calling interface

The calling interface of the **xp_sat_att_get_matrix** CFI function is the following (input parameters are underlined):

7.23.3 Input parameters

The xp sat att get matrix CFI function has the following input parameters:

Table 62: Input parameters of xp_sat_att_get_matrix function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_trans_id	xp_sat_trans_id *	-	Satellite transformation ID.	-	-

7.23.4 Output parameters

The output parameters of the xp_sat_att_get_matrix CFI function are:

Issue: 10/05/2019

Page: 145

Table 63: Output parameters of xp_sat_att_get_matrix function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xp_sat_att_get_matr ix	long	-	Status flag	-	-
data	xp_matrix_mode I_str	-	Attitude initialization data	-	-

7.23.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

- The sat trans id was not initialised.
- The sat_trans_id initialization does not allow the use of this function.

Date:

Issue: 10/05/20 197

Page: 146

7.24 xp_sat_att_set_matrix

7.24.1 Overview

The **xp_sat_att_set_matrix** CFI function changes matrix data used for the satellite attitude initialization. It is checked that the input matrix is orthonormal.

Note on matrix notation:

If XYZ are the axes of the original reference frame, and X'Y'Z' are the axes of the rotated frame, the rows of the rotation matrix are respectively X, Y and Z axes expressed in X'Y'Z' system.

In the C representation, M[0][], M[1][], M[2][] are respectively 1st, and and 3rd row of a rotation matrix M.

The rotation matrix M satisfies the following equivalence:

$$V = M*V$$

where V' is a vector expressed in the X'Y'Z' reference system and V is expressed in the XYZ reference system.

7.24.2 Calling interface

The calling interface of the **xp_sat_att_set_matrix** CFI function is the following (input parameters are underlined):

7.24.3 Input parameters

The **xp** sat att set matrix CFI function has the following input parameters:

Table 64: Input parameters of xp_sat_att_set_matrix function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_trans_id	xp_sat_trans_i d *	-	Satellite transformation ID (input / output parameter)	-	-

sat_trans_id	xp_sat_trans_id *	_	Satellite transformation ID (input / output parameter)	-	-

7.30.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

- The sat trans id was not initialised.
- The sat trans id initialization does not allow the use of this function.
- There was an error in the calculation of the rotation matrix from angles.

Date:

Issue: 10/05/20 197

Page: 160

7.31 xp_sat_att_get_quat_plus_matrix

7.31.1 Overview

The **xp_sat_att_get_quat_plus_matrix** CFI function returns satellite attitude data from the satellite attitude Id. that was initialized with quaternions and a rotation matrix.

Note on matrix notation:

If XYZ are the axes of the original reference frame, and X'Y'Z' are the axes of the rotated frame, the rows of the rotation matrix are respectively X, Y and Z axes expressed in X'Y'Z' system.

In the C representation, M[0][], M[1][], M[2][] are respectively 1st, and and 3rd row of a rotation matrix M.

The rotation matrix M satisfies the following equivalence:

$$V = M*V$$

where V' is a vector expressed in the X'Y'Z' reference system and V is expressed in the XYZ reference system.

7.31.2 Calling interface

The calling interface of the **xp_sat_att_get_quat_plus_matrix** CFI function is the following (input parameters are <u>underlined</u>):

7.31.3 Input parameters

The xp sat att get quat plus matrix CFI function has the following input parameters:

Table 78: Input parameters of xp_sat_att_get_quat_plus_matrix function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_trans_id	xp_sat_trans_i d *	-	Satellite transformation ID.	-	-

7.32 xp_sat_att_set_quat_plus_matrix

7.32.1 Overview

The **xp_sat_att_set_quat_plus_matrix** CFI function changes the initalization data in the satellie attitude Id. when it was initialised with quaternions and a rotation matrix. The input quaternions are checked to be normalized, and the input matrix is checked to be orthonormal.

Note on matrix notation:

If XYZ are the axes of the original reference frame, and X'Y'Z' are the axes of the rotated frame, the rows of the rotation matrix are respectively X, Y and Z axes expressed in X'Y'Z' system.

In the C representation, M[0][], M[1][], M[2][] are respectively 1st, and and 3rd row of a rotation matrix M.

The rotation matrix M satisfies the following equivalence:

$$V = M*V$$

where V' is a vector expressed in the X'Y'Z' reference system and V is expressed in the XYZ reference system.

7.32.2 Calling interface

The calling interface of the **xp_sat_att_set_quat_plus_matrix** CFI function is the following (input parameters are <u>underlined</u>):

7.32.3 Input parameters

The xp sat att set quat plus matrix CFI function has the following input parameters:

Table 80: Input parameters of xp_sat_att_set_quat_plus_matrix function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range

7.33 xp_instr_att_angle_init

7.33.1 Overview

The **xp_instr_att_angle_init** CFI function initialises the instrument attitude mispointing angles for a given satellite and instrument with a user-provided set of values. The initialised values will be stored in the *instr trans id* output structure.

7.33.2 Calling Interface

The calling interface of the **xp_instr_att_angle_init** CFI function is the following (input parameters are <u>underlined</u>):

The XP NUM ERR INSTR ATT ANGLE INIT constant is defined in the file explorer_pointing.h.

Date:

Issue: 10/05/20 197

Page: 165

7.33.3 Input Parameters

The **xp_instr_att_angle_init** CFI function has the following input parameters:

Table 82: Input parameters of xp_instr_att_angle_init function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
ang	double[3]	[0]	Pitch mispointing angle (Satellite Attitude Frame)	deg	If no better value, assume 0.0
		[1]	Roll mispointing angle (Satellite Attitude Frame)	deg	If no better value, assume 0.0
		[2]	Yaw mispointing angle (Satellite Attitude Frame)	deg	If no better value, assume 0.0
offset	double[3]	all	Instrument Frame Origin position vector (Satellite Attitude Frame)	m	-

7.33.4 Output Parameters

The output parameters of the xp_instr_att_angle_init CFI function are:

7.34 xp_instr_att_matrix_init

7.34.1 Overview

The **xp_instr_att_matrix_init** CFI function initialises the instrument attitude mispointing angles for a given satellite and instrument with a user-provided matrix. The initialised values will be stored in the *instr_trans_id* output structure. Input matrix is checked to be orthonormal.

Note on matrix notation:

If XYZ are the axes of the original reference frame, and X'Y'Z' are the axes of the rotated frame, the rows of the rotation matrix are respectively X, Y and Z axes expressed in X'Y'Z' system.

In the C representation, M[0][], M[1][], M[2][] are respectively 1st, and and 3rd row of a rotation matrix M.

The rotation matrix M satisfies the following equivalence:

$$V = M*V$$

where V' is a vector expressed in the X'Y'Z' reference system and V is expressed in the XYZ reference system.

7.34.2 Calling Interface

The calling interface of the **xp_instr_att_matrix_init** CFI function is the following (input parameters are underlined):

The XP NUM ERR INSTR ATT MATRIX INIT constant is defined in the file explorer pointing.h.

7.35 xp_instr_att_init_harmonic

7.35.1 Overview

The **xp_instr_att_init_harmonic** CFI function initialises the instrument attitude mispointing angles (i.e. roll, pitch, yaw) for a given satellite and instrument with a user-provided set of values. The initialised values will be stored in the *instr_trans_id* output structure.

The mispointing angle (attitude angle in the formula) will be calculated by functions using such instr_trans_id (i.e. xp_attitude_compute or xp_change_frame) according to the following formula (the "angle" variable will be calculated as in xl position on orbit (see [LIB SUM]), using as inputs:

- the input state vector in EF passed to such functions;
- the angle_type passed as input to xp_instr_att_init_harmonic.

7.35.2 Calling Interface

The calling interface of the **xp_instr_att_init_harmonic** CFI function is the following (input parameters are underlined):

```
#include <explorer pointing.h>
    long angle type, num terms[3];
    long harmonic type pitch [XP MAX NUM HARMONIC],
         harmonic type roll[XP MAX NUM HARMONIC],
         harmonic type yaw[XP MAX NUM HARMONIC];
    double harmonic coef pitch[XP MAX NUM HARMONIC],
        harmonic coef roll[XP MAX NUM HARMONIC],
        harmonic coef yaw[XP MAX NUM HARMONIC];
    double offset[3];
    xp instr trans id instr trans id = {NULL};
    long ierr[XP_NUM_ERR_INSTR_ATT_INIT_HARMONIC], status;
    status = xp instr att init harmonic (& angle type, num terms,
                                    harmonic type pitch,
                                    harmonic type roll,
                                    harmonic type yaw,
                                    harmonic coef pitch,
                                    harmonic coef roll,
                                    harmonic coef yaw,
                                    offset,
```

7.36 xp_instr_att_init_file

7.36.1 Overview

The **xp_instr_att_init_file** CFI function initialises the instrument attitude mispointing angles for a given satellite reading values from the attitude file(s). The validity time or orbital range for the attitude angles can be specified by the user. The initialised values will be kept in memory and used by other CFI functions.

In order to read files, xp_instr_att_init_file function internally uses Data Handling functions. Please refer to [D H SUM], in particular sections 4.2 and 4.3, for further details.

7.36.2 Calling Interface

The calling interface of the **xp_instr_att_init_file** CFI function is the following (input parameters are <u>underlined</u>):

The XP NUM ERR INSTR ATT INIT FILE constant is defined in the file explorer_pointing.h.

Date:

Issue: 10/05/2019

Page: 176

7.36.3 Input Parameters

The **xp_instr_att_init_file** CFI function has the following input parameters:

Table 91: Input parameters of xp_instr_att_init_file function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
time_id	xl_time_i d*	-	Structure that contains the time correlations.	-	-
n_files	long *	-	Number of reference data files	-	> 0
instrument_file	char **	-	Filenames of the reference data files. In case multiple files are used, the files should be time ordered. The supported Attitude File format is the Generic Attitude File as described in [D_H_SUM]	-	
time_init_mode	long *	-	Flag for selecting the time range of the initialization.	-	Select either: · XP_SEL_TIME · XP_SEL_FILE
time_ref	long *	-	Time reference ID	-	Complete
time0	double*	-	If:time_init_mode=XP_SEL_TIME Start of the time range defined by [time0,time1]	Decimal days (Processing format)	[-18262.0,36524.0]
time1	double*	-	If:time_init_mode=XP_SEL_TIME End of the time range defined by [time0,time1]	Decimal days (Processing format)	[-18262.0,36524.0] > time0

It is possible to use enumeration values rather than integer values for some of the input arguments:

- Time Reference ID: time ref. See [GEN SUM].
- Time Init Mode ID: time init mode. See current document, Table 3.

7.36.4 Output Parameters

The output parameters of the **xp_instr_att_init_file** CFI function are:

Table 92: Output parameters of xp_instr_att_init_file

7.37 xp_instr_att_close

7.37.1 Overview

The **xp_instr_att_close** CFI function cleans up any memory allocation performed by the instrument attitude initialization functions.

7.37.2 Calling Interface

The calling interface of the **xp_instr_att_close** CFI function is the following (input parameters are underlined):

```
#include <explorer_pointing.h>
{
    xp_instr_trans_id instr_trans_id = {NULL};
    long ierr[XP_NUM_ERR_INSTR_ATT_CLOSE], status;

    status = xp_instr_att_close(&instr_trans_id, ierr);
}
```

The XP NUM ERR INSTR ATT CLOSE constant is defined in the file explorer_pointing.h.

7.37.3 Input Parameters

The **xp** instr att close CFI function has the following input parameters:

Table 94: Input parameters of xp_instr_att_close function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
instr_trans_id	xp_instr_trans _id*	-	Structure that contains the Instr. Trans.	-	-

7.37.4 Output Parameters

The output parameters of the **xp** instr att close CFI function are:

_str		data		
------	--	------	--	--

7.38.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

- The instr_trans_id was not initialised.
- The instr trans id initialization does not allow the use of this function.

Date:

Issue: 10/05/20 197

Page: 182

7.39xp_instr_att_set_angles

7.39.1 Overview

The **xp_instr_att_set_angles** CFI function changes the harmonic data used for the satellite attitude initialization.

7.39.2 Calling interface

The calling interface of the **xp_instr_att_set_angles** CFI function is the following (input parameters are <u>underlined</u>):

7.39.3 Input parameters

The xp_instr_att_set_angles CFI function has the following input parameters:

Table 99: Input parameters of xp_instr_att_set_angles function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
instr_trans_i d	xp_instr_trans _id *	-	Instrument transformation ID (input / output parameter)	-	-
data	xp_angle_mod el_str	-	Attitude initialization data	-	-

7.39.4 Output parameters

The output parameters of the xp_instr_att_set_angles CFI function are:

Table 100: Output parameters of xp_instr_att_set_angles function

instr_trans_id	xp_instr_trans_i d *	-	Instrument transformation ID (input / output parameter)	-	-

7.39.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

- The instr_trans_id was not initialised.
- The instr trans id initialization does not allow the use of this function.

Date:

Issue: 10/05/20 197

Page: 184

7.40 xp_instr_att_get_matrix

7.40.1 Overview

The **xp_instr_att_get_matrix** CFI function returns the matrix data used for the satellite attitude initialization.

Note on matrix notation:

If XYZ are the axes of the original reference frame, and X'Y'Z' are the axes of the rotated frame, the rows of the rotation matrix are respectively X, Y and Z axes expressed in X'Y'Z' system.

In the C representation, M[0][], M[1][], M[2][] are respectively 1st, and and 3rd row of a rotation matrix M.

The rotation matrix M satisfies the following equivalence:

$$V = M*V$$

where V' is a vector expressed in the X'Y'Z' reference system and V is expressed in the XYZ reference system.

7.40.2 Calling interface

The calling interface of the **xp_instr_att_get_matrix** CFI function is the following (input parameters are underlined):

7.40.3 Input parameters

The **xp** instr att get matrix CFI function has the following input parameters:

Table 101: Input parameters of xp_instr_att_get_matrix function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
instr_trans_i d	xp_instr_trans_id *	-	Instrument transformation ID.	-	-

Date:

Issue: 10/05/2019

Page: 185

7.40.4 Output parameters

The output parameters of the xp_instr_att_get_matrix CFI function are:

Table 102: Output parameters of xp_instr_att_get_matrix function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xp_instr_att_get_ma trix	long	-	Status flag	-	-
data	xp_matrix_mode I_str	-	Attitude initialization data	-	-

7.40.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

- The instr trans id was not initialised.
- The instr trans id initialization does not allow the use of this function.

7.41 xp_instr_att_set_matrix

7.41.1 Overview

The **xp_instr_att_set_matrix** CFI function changes matrix data used for the satellite attitude initialization. The matrix is checked to be orthonormal.

Note on matrix notation:

If XYZ are the axes of the original reference frame, and X'Y'Z' are the axes of the rotated frame, the rows of the rotation matrix are respectively X, Y and Z axes expressed in X'Y'Z' system.

In the C representation, M[0][], M[1][], M[2][] are respectively 1st, and and 3rd row of a rotation matrix M.

The rotation matrix M satisfies the following equivalence:

$$V = M*V$$

where V' is a vector expressed in the X'Y'Z' reference system and V is expressed in the XYZ reference system.

7.41.2 Calling interface

The calling interface of the **xp_instr_att_set_matrix** CFI function is the following (input parameters are underlined):

7.41.3 Input parameters

The **xp** instr att set matrix CFI function has the following input parameters:

Table 103: Input parameters of xp_instr_att_set_matrix function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
instr_trans_i d	xp_instr_trans _id *	-	Instrument transformation ID (input / output parameter)	-	-
data	xp_angle_mod el_str	-	Attitude initialization data	-	-

Date:

Issue: 10/05/2019

Page: 187

7.41.4 Output parameters

The output parameters of the xp instr att set matrix CFI function are:

Table 104: Output parameters of xp_instr_att_set_matrix function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xp_instr_att_set_ma trix	long	-	Status flag	-	-
instr_trans_id	xp_instr_trans_i d *	-	Instrument transformation ID (input / output parameter)	-	-

7.41.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

- The instr trans id was not initialised.
- The instr_trans_id initialization does not allow the use of this function.

Date:

Page: 188

7.42 xp_instr_att_get_harmonic

7.42.1 Overview

The **xp_instr_att_get_harmonic** CFI function returns harmonic data used for the satellite attitude initialization.

7.42.2 Calling interface

The calling interface of the **xp_instr_att_get_harmonic** CFI function is the following (input parameters are <u>underlined</u>):

7.42.3 Input parameters

The xp_instr_att_get_harmonic CFI function has the following input parameters:

Table 105: Input parameters of xp_instr_att_get_harmonic function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
instr_trans_i d	xp_instr_trans _id *	-	Instrument transformation ID.	-	-

7.42.4 Output parameters

The output parameters of the xp_instr_att_get_harmonic CFI function are:

Issue: 10/05/20 197

Page: 192

7.44 xp_instr_att_get_file

7.44.1 Overview

The **xp_instr_att_get_file** CFI function returns satellite attitude data from the satellite attitude Id. that was initialized with a file.

7.44.2 Calling interface

The calling interface of the **xp_instr_att_get_file** CFI function is the following (input parameters are underlined):

7.44.3 Input parameters

The **xp_instr_att_get_file** CFI function has the following input parameters:

Table 109: Input parameters of xp_instr_att_get_file function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
instr_trans_i d	xp_instr_trans _id *	-	Instrument transformation ID.	-	-

7.44.4 Output parameters

The output parameters of the xp instr att get file CFI function are:

7.44.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

- The instr trans id was not initialised.
- The instr_trans_id initialization does not allow the use of this function.

Date:

Issue: 10/05/20 197

Page: 194

7.45 xp_instr_att_set_file

7.45.1 Overview

The **xp_instr_att_set_file** CFI function changes the initialization data in the satellite attitude Id. when it was initialised with a file. Quaternions are checked to be normalized.

7.45.2 Calling interface

The calling interface of the **xp_instr_att_set_file** CFI function is the following (input parameters are <u>underlined</u>):

7.45.3 Input parameters

The **xp_instr_att_set_file** CFI function has the following input parameters:

Table 111: Input parameters of xp_instr_att_set_file function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
instr_trans_i d	xp_instr_trans _id *	-	Instrument transformation ID (input / output parameter)	-	-
data	xp_instr_att_fil e_model_str	-	Attitude initialization data	-	-

7.45.4 Output parameters

The output parameters of the xp_instr_att_set_file CFI function are:

Table 112: Output parameters of xp_instr_att_set_file function

instr_trans_id	xp_instr_trans_i d *	-	Instrument transformation ID (input / output parameter)	-	-

7.45.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

- The instr trans id was not initialised.
- The instr trans id initialization does not allow the use of this function.

7.46 xp_set_az_el_definition

7.46.1 Overview

The **xp_set_az_el_definition** function sets an user-defined azimuth/elevation in a satellite nominal attitude id, satellite attitude id or instrument attitude id.

7.46.2 Calling interface

The calling interface of the **xp_set_az_el_definition** CFI function is the following (input parameters are <u>underlined</u>):

7.46.3 Input parameters

The xp set az el definition CFI function has the following input parameters:

Date:

Issue: 10/05/2019

Page: 196

Table 113: Input parameters of xp_instr_att_set_file function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
att_frame_i d	void*	-	Attitude where the definition will be inserted.	-	It must be a Satellite Nominal id (xp_sat_nom_tran s_id*), satellite attitude id (xp_sat_trans_id*) or instrument attitude id (xp_instr_trans_id*).
azel_def	xl_az_el_defini tion	-	Azimuth/elevation definition	-	-

7.46.4 Output parameters

The output parameters of the xp_set_az_el_definition CFI function are:

Table 114: Output parameters of xp_instr_att_set_file function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
ierr	long	-	Error vector	-	-

7.46.5 Warnings and errors

This function returns error if the input id is not initialized, it is not of the correct type, or there is a problem with the azimuth/elevation definition introduced by the user. In Table 115 are summarized the possible errors.

Table 115: Error messages of xp_set_az_el_definition function

Error type	Error message	Cause and impact	Error code	Error No
ERR	Argument ID is not initialized.	No calculation performed	XP_CFI_SET_AZ_EL_DE F_ID_NOT_INITIALIZE D_ERR	0
ERR	Argument ID is not a satellite nominal, satellite or instrument attitude ID.	No calculation performed	XP_CFI_SET_AZ_EL_DE F_NOT_ATTITUDE_ID_ ERR	1

Issue: 10/05/2019

Page: 198

7.47 xp_attitude_define

7.47.1 Overview

The **xp_attitude_define** CFI function initializes the satellite nominal attitude, satellite attitude and instrument attitude according to the input data.

The input data is stored in a structure of type xd_attitude_definition_data (see section 6.3 of [D_H_SUM]). The user can fill this structure within his application program or by reading an attitude definition file using function xd read att def (see [D H SUM]).

7.47.2 Calling Interface

The calling interface of the **xp_attitude_define** CFI function is the following (input parameters are <u>underlined</u>):

The XP NUM ERR ATTITUDE DEFINE constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 199

7.47.3 Input Parameters

The **xp_attitude_define** CFI function has the following input parameters:

Table 116: Input parameters of xp_attitude_define function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
Data	xd_attitude_ definition_da ta	-	Attitude file definition data	-	-

7.47.4 Output Parameters

The output parameters of the xp attitude define CFI function are:

Table 117: Output parameters of xp_attitude_define

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_nom_trans_i d	xp_sat_nom_t rans _id*	_	Structure that contains the Satellite nominal Transformation	-	-
sat_trans_id	xp_sat_trans _id*	-	Structure that contains the Satellite Transformation	-	-
instr_trans_id	xp_instr_trans _id*	-	Structure that contains the Instrument Transformation	-	-
ierr	long	-	Error vector	-	-

7.47.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_attitude_define** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_attitude_define** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

7.48 xp_run_init

7.48.1 Overview

The **xp_run_init** CFI function adds to the *run id* the sat_nom_trans_id, sat_trans_id, instr_trans_id, atmos Id and dem Id.

7.48.2 Calling interface

The calling interface of the **xp_run_init** CFI function is the following:

```
#include <explorer pointing.h>
    long run id;
    xp sat nom trans id sat nom trans id = {NULL};
    xp sat trans id
                        sat trans id = {NULL};
    xp instr trans id
                         instr trans id = {NULL};
    xp atmos id
                        atmos id = {NULL};
    xp dem id
                        dem id = {NULL};
    long ierr[XP NUM ERR RUN INIT], status;
    status = xp run init (&run id, &sat nom trans id,
                            &sat trans id, &instr trans id,
                            &atmos id, &dem id,
                            ierr);
```

7.49 xp_run_get_ids

7.49.1 Overview

The **xp_run_get_ids** CFI function returns the *ids* being used..

7.49.2 Calling interface

The calling interface of the **xp run get ids** CFI function is the following:

```
#include <explorer pointing.h>
    long run id;
    xp sat nom trans id sat nom trans id = {NULL};
    xp sat trans id
                         sat trans id = {NULL};
    xp instr trans id
                        instr trans id = {NULL};
    xp atmos id
                         atmos id = {NULL};
                         dem id = {NULL};
    xp dem id
                     (&run id,
    xp run get ids
                      &sat_nom_trans_id,
                      &sat trans id,
                      &instr trans id,
                      &atmos id,
                      &dem id);
}
```

7.50 xp_run_close

7.50.1 Overview

The xp_run_close CFI function cleans up any memory allocation performed by the initialization functions.

7.50.2 Calling interface

The calling interface of the **xp run close** CFI function is the following:

```
#include <explorer_pointing.h>
{
        long run_id;
        xp_run_close (&run_id);
}
```

7.50.3 Input parameters

The **xp_run_close** CFI function has the following input parameters:

Table 124: Input parameters of xp_run_close function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
run_id	long *	-	Run ID	-	>=0

7.50.4 Output parameters

The output parameters of the **xp run close** CFI function are:

Table 125: Output parameters of xp_run_close function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range

7.52 xp_attitude_compute

7.52.1 Overview

The **xp_attitude_compute** CFI function calculates the Attitude Frame for a given S/C state vector.

Note: a correction can be applied in order to compensate the travel time of Sun light travel time. This correction is not applied with default model. To activate this correction, the Sun model in xl_model_id must be initialized with the enum XL_MODEL_SUN_TRAVEL_TIME using the function xl_model_init (see [LIB SUM]).

7.52.2 Calling interface

The calling interface of the **xp_attitude_compute** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>
{
    xl model id
                         model id = {NULL};
                         time id = \{NULL\};
    xl time id
    xp sat nom trans id sat nom trans id = {NULL};
                         sat trans id = {NULL};
    xp sat trans id
                         instr trans id = {NULL};
    xp instr trans id
    xp attitude id
                         attitude id = {NULL};
    long time ref, target_frame;
    double time, pos[3], vel[3], acc[3];
    long ierr[XP NUM ERR ATTITUDE COMPUTE];
    status =xp attitude compute(&model id, &time id,
                                 &sat nom trans id,
                                 &sat trans id,
                                 &instr trans id,
                                 &attitude id,
                                   /* input/output */
                                 &time ref, &time, pos, vel, acc,
                                 &target frame,
                                 ierr);
    /* Or, using the run id */
    long run id;
```

Date:

Issue: 10/05/2019

Page: 210

The XP NUM ERR ATTITUDE COMPUTE constant is defined in the file explorer_pointing.h.

7.52.3 Input parameters

The **xp_attitude_compute** CFI function has the following input parameters:

Table 128: Input parameters of xp_attitude_compute function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
model_id	xl_model_id*	-	Model ID.	-	-
time_id	xl_time_id*	-	Structure that contains the time correlations.	-	-
sat_nom_trans _id	xp_sat_nom _trans_id*	-	Structure that contains the Sat. Nom. Trans.	-	-
sat_trans_id	xp_sat_trans _id*	-	Structure that contains the Sat. Trans.	-	-
instr_trans_id	xp_instr_tran s_id*	-	Structure that contains the Instr. Trans.	-	-
attitude_id	xp_attitude_i d*	-	Structure that contains the Attitude (input/output)	-	-
time_ref	long *	-	Time reference ID	-	Complete
time	double	-	Time in Processing Format	Decimal days, MJD2000	[-18262.0,36524.0]
pos[3]	double	all	Satellite position vector (Earth Fixed CS)	m	-
vel[3]	double	all	Satellite velocity vector (Earth Fixed CS)	m/s	-
acc[3]	double	all	Satellite acceleration vector (Earth Fixed CS)	m/s²	-
target_frame	long *	-	Attitude FrameID	-	Complete

It is possible to use enumeration values rather than integer values for some of the input arguments:

- Time Reference ID: time_ref. See [GEN_SUM].
- Attitude Frame ID: attitude frame id. See current document, Table 3.

7.52.4 Output parameters

The output parameters of the **xp_attitude_compute** CFI function are:

Table 129: Output parameters of xp_attitude_compute function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
attitude_id	xp_attitude _id*	-	Structure that contains the Attitude. (input/output)	-	-
ierr	long	-	Error vector	-	-

7.52.5 Warnings and errors

Next table lists the possible error messages that can be returned by the **xp_attitude_compute** CFI function after translating the returned extended status flag into the equivalent list of error messages by calling the function of the EO POINTING software library **xl get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the extended status flag returned by the **xp_attitude_compute** function by calling the function of the EO POINTING software library **xl get code** (see [GEN SUM])

Table 130: Error messages of xp_attitude_compute function

7.53 xp_attitude_user_set

7.53.1 Overview

The **xp_attitude_user_set** CFI function assigns a user defined Attitude Frame to the *attitude Id*. Input matrix is checked to be orthonormal.

Note on matrix notation:

If XYZ are the axes of the original reference frame, and X'Y'Z' are the axes of the rotated frame, the rows of the rotation matrix are respectively X, Y and Z axes expressed in X'Y'Z' system.

In the C representation, M[0][], M[1][], M[2][] are respectively 1st, and and 3rd row of a rotation matrix M.

The rotation matrix M satisfies the following equivalence:

$$V = M*V$$

where V' is a vector expressed in the X'Y'Z' reference system and V is expressed in the XYZ reference system.

7.53.2 Calling interface

The calling interface of the **xp_attitude_user_set** CFI function is the following (input parameters are underlined):

```
#include <explorer pointing.h>
    xl model id
                         model id = {NULL};
    xl time id
                         time id = \{NULL\};
                         attitude id = {NULL};
    xp attitude id
    long time ref, target frame;
    double time, pos[3], vel[3], acc[3];
    double matrix[3][3];
    double matrix rate[3][3];
    double matrix rate rate[3][3];
    double offset[3],;
    long ierr[XP NUM ERR ATTITUDE USER SET];
    long xp attitude user set (&model id, &time id,
                                &attitude id,
                                  /* input / output */
                                &time ref, &time, pos, vel, acc,
                                &target frame,
                                matrix, matrix rate, matrix rate rate,
                                offset,
                                ierr);
```

Date:

Issue: 10/05/2019

Page: 215

The XP NUM ERR ATTITUDE USER SET constant is defined in the file explorer_pointing.h.

7.53.3 Input parameters

The **xp_attitude_user_set** CFI function has the following input parameters:

Table 131: Input parameters of xp_attitude_user_set function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
model_id	xl_model_id*	-	Model ID	-	-
time_id	xl_time_id*	-	Structure that contains the time correlations.	-	-
attitude_id	xp_attitude_i d*	-	Structure that contains the Attitude (input/output)	-	-
time_ref	long *	-	Time reference ID	-	Complete
time	double	-	Time in Processing Format	Decimal days, MJD2000	[-18262.0,36524.0]
pos[3]	double	all	Satellite position vector (Earth Fixed CS)	m	-
vel[3]	double	all	Satellite velocity vector (Earth Fixed CS)	m/s	-
acc[3]	double	all	Satellite acceleration vector (Earth Fixed CS)	m/s ²	-
target_frame	long *	-	Attitude FrameID	-	Complete
matrix[3][3]	double	all	Matrix representing the transformation from ToD to target_frame	-	-

Date:

Issue: 10/05/20 197

Page: 216

matrix_rate [3][3]	double	all	Matrix representing the transformation rate from ToD to target_frame	-	-
matrix_rate_rate [3][3]	double	all	Matrix representing the transformation rate rate from ToD to target_frame	-	-
offset[3]	double	all	Offset in the instrument frame origin	m	-

It is possible to use enumeration values rather than integer values for some of the input arguments:

- Time Reference ID: time ref. See [GEN SUM].
- Attitude Frame ID: attitude frame id. See current document, Table 3.

7.53.4 Output parameters

The output parameters of the xp attitude user set CFI function are:

Table 132: Output parameters of xp_attitude_user_set function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
attitude_id	xp_attitude _id*	-	Structure that contains the Attitude. (input/output)	-	-
ierr	long	-	Error vector	-	-

7.53.5 Warnings and errors

Next table lists the possible error messages that can be returned by the **xp_attitude_user_set** CFI function after translating the returned extended status flag into the equivalent list of error messages by calling the function of the EO POINTING software library **xl get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the extended status flag returned by the **xp_attitude_user_set** function by calling the function of the EO_POINTING software library **xl_get_code** (see [GEN_SUM]).

Table 133: Error messages of xp_attitude_user_set function

Page: 218

7.54 xp_get_attitude_data

7.54.1 Overview

The **xp_get_attitude_data** CFI function computes the quaternions or attitude angles (roll, pitch, yaw) that define the rotation between two reference frames:

- A source reference frame (given as input).
- The attitude reference frame given by the input attitude_id. Note that the attitude_id has to be previously computed using the functions xp_attitude_compute or xp_attitude_user_set.

7.54.2 Calling interface

The calling interface of the **xp_get_attitude_data** CFI function is the following (input parameters are underlined):

The XP NUM ERR GET ATTITUDE DATA constant is defined in the file explorer pointing.h.

7.54.3 Input parameters

The xp get attitude data CFI function has the following input parameters:

Table 134: Input parameters of xp_get_attitude_data function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
attitude_id	xp_attitude_i d*		Structure that contains the Attitude	-	-

Date:

Issue: 10/05/2019

Page: 219

data_type	long	-	Requested data type: angles or quaternions.	-	XD_ATT_QUATERNIONS XD_ATT_ANGLES
source_ref_type	long	-	Source reference type: External or Satellite.	-	XP_FRAME_FLAG_EXT XP_FRAME_FLAG_SAT

7.55 xp_gen_attitude_data

7.55.1 Overview

The **xp_gen_attitude_data** function computes a list of quaternions or attitude angles (roll, pitch, yaw) at an interval given by the user (with a regular time separation) that define the rotation between two reference frames:

- A source reference frame (given as input).
- The attitude frame given by the input attitude definition file.

7.55.2 Calling interface

The calling interface of the **xp_gen_attitude_data** function is the following (input parameters are underlined):

```
#include <explorer pointing.h>
    xo orbit id
                      orbit id = {NULL};
    xp attitude def att def;
    xo time interval time interval;
    double
                      time step;
    long
                      data type;
    long
                      source ref type;
    long
                      source ref;
                      *att file;
    xd att file
    long ierr[XP NUM ERR GEN ATTITUDE DATA];
    long xp gen attitude data(&orbit id,
                               &att def,
                               &time_interval,
                               &time step,
                                &data type,
                                &source ref type,
                                &source ref,
                                /* output */
                                &att file,
                                ierr);
    /* Or, using the run id */
    long run id;
    long xp_gen_attitude_data_run(&run_id,
                                    &time interval,
```

Date:

Issue: 10/05/2019

Page: 222

```
&time_step,
&data_type,
&source_ref_type,
&source_ref,
/* output */
&att_file,
ierr);
```

The XP_NUM_ERR_GEN_ATTITUDE_DATA constant is defined in the file explorer_pointing.h.

7.55.3 Input parameters

The xp_gen_attitude_data CFI function has the following input parameters:

Table 137: Input parameters of xp_gen_attitude_data function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
orbit_id	xp_orbit_id*	-	Structure that contains the satellite orbit data	-	-
att_def	xp_attitude_def*	-	Structure defining the attitude frames. It also defines the destination frame.	-	
time_interval	xo_time_interva l*	-	start-stop time interval for the data generation	-	-
time_step	double*	-	Time step between records in the output file data.	seconds	-
data_type	long	-	Requested data type: angles or quaternions.	-	XD_ATT_QUATERNIONS XD_ATT_ANGLES
source_ref_type	long	-	Source reference type: External or Satellite.	-	XP_FRAME_FLAG_EXT XP_FRAME_FLAG_SAT

7.56 xp_gen_attitude_file

7.56.1 Overview

The **xp_gen_attitude_file** function creates an attitude file with the list of quaternions or attitude angles (roll, pitch, yaw) at an interval given by the user (with a regular time separation) that define the rotation between two reference frames:

- A source reference frame (given as input).
- The attitude frame given by the input attitude definition file.

7.56.2 Calling interface

The calling interface of the **xp_gen_attitude_file** function is the following (input parameters are underlined):

```
#include <explorer pointing.h>
    xo orbit id
                      orbit id = {NULL};
    xp attitude def
                      att def;
    xo time interval time interval;
                      time step;
    double
    long
                       data type;
    long
                       source ref type;
    long
                       source ref;
    char
                       *output dir,
                       *file class,
    char
    long
                       *version number,
    char
                       *fh system,
    char
                       filename[XD MAX STR],
    long ierr[XP NUM ERR GEN ATTITUDE_FILE];
    long xp gen attitude file (&orbit id,
                                &att def,
                                &time interval,
                                &time step,

                                fh system,
                                /* input/output */
                                filename,
                                ierr);
```

The XP NUM ERR GEN ATTITUDE FILE constant is defined in the file explorer pointing.h.

7.56.3 Input parameters

The xp gen attitude file CFI function has the following input parameters:

Table 140: Input parameters of xp_gen_attitude_file function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
orbit_id	xp_orbit_id*	-	Structure that contains the satellite orbit data	-	-
att_def	xp_attitude_def	-	Structure defining the attitude frames. It also defines the destination frame.	-	
time_interval	xo_time_interva	-	start-stop time interval for the data generation	-	-
time_step	double*	-	Time step between records in the output file data.	seconds	-
data_type	long	-	Requested data type:	-	XD_ATT_QUATERNIONS

Date:

Issue: 10/05/2019

Page: 227

			angles or quaternions.		XD_ATT_ANGLES
source_ref_type	long	-	Source reference type: External or Satellite.	-	XP_FRAME_FLAG_EXT XP_FRAME_FLAG_SAT
source_ref	long	-	Source reference CS	-	XL_BM2000, XL_HM2000, XL_GM2000, XL_MOD, XL_TOD, XL_PEF, XL_EF XL_LIF, XL_GALACTIC, XL_SAT_ORBITAL_REF, XL_SAT_NOMINAL_ATT, XL_SAT_ATT, XL_INSTR_ATT
output_dir	char	-	Directory for the output file. If empty, the current directory is chosen.	-	-
file_class	char	-	File class	-	-
version_number	long	-	File version	-	-
fh_system	char	-	system	-	-
filename	char	-	Output file name. If emtpy, the file is generated autmatically and returned to this variable.	-	-

It is possible to use enumeration values rather than integer values for some of the input arguments:

- data type: See XD Attitude data type enum [D H SUM].
- source ref type: See enumeration XP Frame flag enum in current document (Table 142).
- source ref: See enumeration XL CS rl enum and XL Attitude fr enum in [LIB SUM].

7.56.4 Output parameters

The output parameters of the **xp_gen_attitude_file** CFI function are:

7.57 xp_attitude_close

7.57.1 Overview

The xp_attitude_close CFI function cleans up any memory allocation performed by the Attitude functions.

7.57.2 Calling Interface

The calling interface of the **xp_attitude_close** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    xp_attitude_id attitude_id = {NULL};
    long ierr[XP_NUM_ERR_ATTITUDE_CLOSE], status;
    status = xp_attitude_close(&attitude_id, ierr);
}
```

The XP NUM ERR ATTITUDE CLOSE constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 233

7.57.3 Input Parameters

The **xp_attitude_close** CFI function has the following input parameters:

Table 143: Input parameters of xp_attitude_close function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
attitude_id	xp_attitude_id		Structure that contains the Attitude.	-	-

7.57.4 Output Parameters

The output parameters of the **xp attitude close** CFI function are:

Table 144: Output parameters of xp_attitude_close

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
ierr	long	-	Error vector	-	-

7.57.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_attitude_close** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_attitude_close** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 145: Error messages of xp_attitude_close function

Page: 234

7.58 xp_attitude_get_id_data

7.58.1 Overview

The xp_attitude_get_id_data CFI function returns attitude initialization data.

7.58.2 Calling interface

The calling interface of the **xp_attitude_get_id_data** CFI function is the following (input parameters are underlined):

```
#include <explorer_lib.h>
{
          xp_attitude_id attitude_id;
          long status;
          xp_attitude_id_data data;
          status = xp_attitude_get_id_data (&attitude_id, &data);
}
```

7.58.3 Input parameters

The xp attitude get id data CFI function has the following input parameters:

Table 146: Input parameters of xp_attitude_get_id_data function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
attitude_id	xp_attitude_id *	-	Structure that contains the Attitude.	-	-

7.58.4 Output parameters

The output parameters of the xp_attitude get id_data CFI function are:

Table 147: Output parameters of xp_attitude_get_id_data function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xp_attitude_get_id_ data	long	-	Status flag	-	-
data	xp_attitude_id_d ata	-	Attitude initialization data	-	-

Date:

Issue: 10/05/2019

Page: 235

7.58.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

- The attitude id was not initialised.
- The attitude id initialization does not allow the use of this function.

Date:

Issue: 10/05/20 197

Page: 236

7.59 xp_attitude_set_id_data

7.59.1 Overview

The **xp_attitude_set_id_data** CFI function changes the harmonic data used for the satellite attitude initialization. Input matrix is checked to be orthonormal.

7.59.2 Calling interface

The calling interface of the **xp_attitude_set_id_data** CFI function is the following (input parameters are <u>underlined</u>):

7.59.3 Input parameters

The xp_attitude_set_id_data CFI function has the following input parameters:

Table 148: Input parameters of xp_attitude_set_id_data function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
attitude_id	xp_attitude_id *	-	Structure that contains the Attitude (input / output parameter)	-	-
data	xp_attitude_id_ data	-	Attitude initialization data	-	-

7.59.4 Output parameters

The output parameters of the xp_attitude_set_id_data CFI function are:

Table 149: Output parameters of xp_attitude_set_id_data function

Date:

Issue: 10/05/2019

Page: 237

		Element	(Reference)	(Format)	
xp_attitude_set_id_ data	long	-	Status flag	-	-
attitude_id	xp_attitude_id *	-	Structure that contains the Attitude. (input / output parameter)	-	-

7.59.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

- The attitude id was not initialised.
- The attitude id initialization does not allow the use of this function.

Date:

Issue: 10/05/20 197

Page: 238

7.60 xp_attitude_get_model_id

7.60.1 Overview

The xp_attitude_get_model_id CFI function retrieves the model ID from the input attitude ID.

7.60.2 Calling interface

The calling interface of the **xp_attitude_get_model_id** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_lib.h>
{
          xp_attitude_id attitude_id = {NULL};
          xl_model_id model_id;
          model_id = xp_attitude_get_model_id (&attitude_id);
}
```

7.60.3 Input parameters

The **xp_attitude_get_model_id** CFI function has the following input parameters:

Table 150: Input parameters of xp_attitude_get_model_id function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
attitude_id	xp_attitude_id *	-	Structure that contains the attitude	-	-

7.60.4 Output parameters

The output parameters of the xp attitude get model id CFI function are:

Table 151: Output parameters of xp_attitude_get_model_id function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xp_attitude_get_model_id	long	-	Status flag	-	-

7.60.5 Warnings and errors

This function does not return any error/warning code. If there is an error, then the returned model ID will be set to NULL (no initialised)

The possible causes of error are:

• The attitude id was not initialised.

Issue: 10/05/2019

Page: 239

Date:

Issue: 10/05/2019

Page: 240

7.61 xp_change_frame

7.61.1 Overview

The **xp_change_frame** CFI function changes the coordinate or attitude frame of a location or direction by keeping the location or direction in inertial space identical. Both all coordinate frames and all attitude frames are supported.

When changing the frame for a location (mode_flag = XP_MODE_FLAG_LOCATION), the difference between the frame origins is taken into account.

When changing the frame for a direction (mode_flag = XP_MODE_FLAG_DIRECTION), the output of the function is a direction, that does not depend on the origin of reference frame of the input vector. Therefore, in this specific case, the instrument offsets are not taken into account.

7.61.2 Calling interface

The calling interface of the **xp_change_frame** CFI function is the following (input parameters are underlined):

```
#include <explorer pointing.h>
    xl model id model id = {NULL};
    long sat id, mode flag, frame flag in, frame id in,
          frame flag out, frame id out, time ref;
    xl time id
                         time id = \{NULL\};
    xp sat nom trans id sat nom trans id = {NULL};
    xp sat trans id
                         sat trans id = {NULL};
                         instr trans id = {NULL};
    xp instr trans id
    double time;
    double pos[3], vel[3], acc[3];
    long deriv;
    double vec in[3], vec rate in[3], vec rate rate in[3];
    double vec_out[3], vec_rate_out[3], vec_rate_rate_out[3];
    long ierr[XP NUM ERR CHANGE FRAME], status;
    status = xp change frame (&sat id, &model id,
                           &time id,
                           &sat nom trans id,
                           &sat trans id,
                           &instr trans id,
                           &mode flag,
```

}

&frame flag in, &frame id in,

Code: EO-MA-DMS-GS-0005

Date:

Issue: 10/05/2019

Page: 241

```
&frame flag out, &frame id out,
                       &time ref, &time,
                       pos, vel, acc, &deriv,
                       vec in, vec rate in, vec rate rate in,
                       vec out, vec rate out, vec rate rate out,
                       ierr);
/* Or, using the run id */
long run id;
status =
            xp change frame run (&run id,
                       &mode flag,
                       &frame flag in, &frame id in,
                       &frame flag out, &frame id out,
                       &time ref, &time,
                       pos, vel, acc, &deriv,
                       vec in, vec rate in, vec rate rate in,
                       vec_out, vec_rate_out, vec_rate_rate_out,
                       ierr);
```

The XP NUM ERR CHANGE FRAME constant is defined in the file explorer_pointing.h.

Date:

Issue: 10/05/2<u>0</u>19

Page: 242

7.61.3 Input parameters

The **xp_change_frame** CFI function has the following input parameters:

Table 152: Input parameters of xp_change_frame function

C name C type		Array Element	Description (Reference)	Unit (Format)	Allowed Range	
sat_id	long *	-	Satellite ID	-	Complete	
model_id	xl_model_id*	-	Model ID	-	-	
time_id	xl_time_id*	-	Structure that contains the time correlations.	-	-	
sat_nom_trans _id	xp_sat_nom_trans _id*	-	Structure that contains the Sat. Nom. Trans.	-	-	
sat_trans_id	xp_sat_trans_id*	-	Structure that contains the Sat. Trans.	-	-	
instr_trans_id	xp_instr_trans_id*	-	Structure that contains the Instr. Trans.	-	-	
mode_flag	long *	-	Selection of location or direction calculus		Complete	
frame_flag_in	long *	-	Selection of Coordinate or Attitude Frame on input		Complete	
frame_id_in	long *		Coordinate Frame id or Attitude Frame id on input		Complete	
frame_flag_out	long *	-	Selection of Coordinate or Attitude Frame on output		Complete	
frame_id_out	long *		Coordinate Frame id or Attitude Frame id on output		Complete	
time_ref	long *	-	Time reference ID	-	Complete	
time	double	-	Time in Processing Format	Decimal days, MJD2000	[-18262.0,36524.0]	
pos[3]	double	all	Satellite position vector (Earth Fixed CS)	m	-	
vel[3]	double	all	Satellite velocity vector (Earth Fixed CS)	m/s	-	
acc[3]	double	all	Satellite acceleration vector (Earth Fixed CS)	m/s ²	-	
deriv	long *	-	Derivative ID	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND	
vec_in[3]	double	all	Position (direction) vector	m or -	-	

Date:

Issue: 10/05/2019

Page: 243

			(Frame in)

7.62 xp_atmos_init

7.62.1 Overview

The **xp_atmos_init** CFI function initialises the atmospheric model for a given satellite. The initialised values will be stored in the *atmos id* output structure.

7.62.2 Calling Interface

The calling interface of the **xp_atmos_init** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    long atmos_mode, atmos_model;
    char atmos_file[XL_MAX_STR];
    xp_atmos_id atmos_id = {NULL};
    long ierr[XP_NUM_ERR_ATMOS_INIT], status;

    status = xp_atmos_init(&atmos_mode, &atmos_model, atmos_file, &atmos_id, ierr);
}
```

The XP NUM ERR ATMOS INIT constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 246

7.62.3 Input Parameters

The **xp_atmos_init** CFI function has the following input parameters:

Table 155: Input parameters of xp_atmos_init function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
atmos_mode	long *	-	Atmosphere initialization mode	-	Complete
atmos_model	long *	-	Not Used in the current implementation.	-	-
atmos_file	char[]	-	File used for atmosphere initialization. It is required when the input atmos_mode is: - User initalization mode (n-z table, see section 10) - User LUT mode	-	Complete

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Atmosphere Initialization Mode: atmos mode. See current document, Table 3.

7.62.4 Output Parameters

The output parameters of the **xp_atmos_init** CFI function are:

Table 156: Output parameters of xp_atmos_init

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
atmos_id	xp_atmos_id*	-	Structure that contains the atmosphere initialization.	-	-
ierr	long	-	Error vector	-	-

7.62.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_atmos_init** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp_get_msg** (see [GEN SUM]).

Date:

Issue: 10/05/2019

Page: 247

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_atmos_init** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 157: Error messages of xp_atmos_init function

Error type	Error message	Cause and impact	Error code	Error No
ERR	Atmosphere Mode ID is not correct	No calculation performed	XP_CFI_ATMOS_INIT_MOD E_ID_ERR	0
ERR	Atmosphere Model ID is not correct	No calculation performed	XP_CFI_ATMOS_INIT_MOD EL_ID_ERR	1
ERR	Atmosphere initialization file could not be opened	No calculation performed	XP_CFI_ATMOS_INIT_FILE_ NOT_OPEN_ERR	2
ERR	Unable to store atmosphere initialization file (not enough memory	No calculation performed	XP_CFI_ATMOS_INIT_MEM ORY_ERR	3
ERR	Error while reading atmosphere initialization file	No calculation performed	XP_CFI_ATMOS_INIT_FILE_ READING_ERR	4

7.63 xp_atmos_close

7.63.1 Overview

The **xp_atmos_close** CFI function cleans up any memory allocation performed by the **xp_atmos_init** functions.

7.63.2 Calling Interface

The calling interface of the **xp_atmos_close** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    xp_atmos_id atmos_id = {NULL};
    long ierr[XP_NUM_ERR_ATMOS_CLOSE], status;
    status = xp_atmos_close(&atmos_id, ierr);
}
```

The XP NUM ERR ATMOS CLOSE constant is defined in the file explorer_pointing.h.

Date:

Issue: 10/05/2019

Page: 249

7.63.3 Input Parameters

The **xp_atmos_close** CFI function has the following input parameters:

Table 158: Input parameters of xp_atmos_close function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
atmos_id	xp_atmos_id*	-	Structure that contains the atmosphere initialization.	-	-

7.63.4 Output Parameters

The output parameters of the **xp_atmos_close** CFI function are:

Table 159: Output parameters of xp_atmos_close

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
ierr	long	-	Error vector	-	-

7.63.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_atmos_close** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_atmos_close** function by calling the function of the EO_POINTING software library **xp get code** (see [GEN SUM]).

Table 160: Error messages of xp_atmos_close function

Error type	Error message	Cause and impact	Error code	Error No
ERR	Could not close the Atmos. Id. as it is not initialized or it is being used	No calculation performed	XP_CFI_ATMOS_CLOSE_ WRONG_ID_ERR	0

7.64 xp_atmos_get_id_data

7.64.1 Overview

The xp_atmos_get_id_data CFI function returns atmospheric initialization data.

7.64.2 Calling interface

The calling interface of the **xp_atmos_get_id_data** CFI function is the following (input parameters are <u>underlined</u>):

7.64.3 Input parameters

The xp atmos get id data CFI function has the following input parameters:

Table 161: Input parameters of xp_atmos_get_id_data function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
atmos_id	xp_atmos_id *	-	Atmospheric Id.	-	-

7.64.4 Output parameters

The output parameters of the xp atmos get id data CFI function are:

Table 162: Output parameters of xp_atmos_get_id_data function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xp_atmos_get_id_d ata	long	-	Status flag	-	-
data	xp_atmos_id_da ta	-	Atmospheric initialization data	-	-

Date:

Issue: 10/05/2\(\right)\frac{1}{2}\(\right)\right)\frac{1}{2}\(\right)\frac{1}{2}\(\ri

Page: 252

7.64.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

• The atmos id was not initialised.

Date:

Issue: 10/05/2019

Page: 253

7.65 xp_dem_init

7.65.1 Overview

The **xp_dem_init** CFI function initializes the digital elevation model (DEM). The DEM is initialized using the DEM configuration file (see [D_H_SUM]) which contains some characteristics that can be configured (see [MCD] for further details about the DEM models).

Finally the initalisation values will be stored in the *dem id* output structure.

7.65.2 Location of DEM dataset

The DEM files are looked for in the directory specified in the field Directory in the DEM configuration file (see [D_H_SUM]). If this field is empty, the DEM files are looked for in the directory where the DEM configuration file is placed.

7.65.3Access to DEM dataset

Depending on the Cache_Type field in the DEM configuration file (see [D_H_SUM]), one of the following methods is used to access the DEM dataset:

- FIFO_CACHE (default): memory is reserved for holding DEM data. As soon as an altitude value is requested and is not yet available in memory, the corresponding data file is loaded in memory. When the maximum size of reserved memory (configurable with the field Cache_Max_Size) is exceeded, memory is made available with a First In First Out policy, that is memory correspondent to the file loaded earliest is made available for the file to be loaded.
- PRELOAD_CACHE: memory is reserved for holding DEM data. The user shall load in memory the needed files in advance via the function xp_dem_id_configure (see section 7.70). Request of a value not available in memory would result in an error.
- NO_CACHE: no memory is reserved for holding DEM data. The dataset is accessed via a single direct I/O access to the file storing the requested value.

In the case of GDEM, due to the special structure of the tiles, loading them to memory can take much time, so it is not recommended the use of cache methods.

Choice of the method that best fits user's needs depends on many aspects including HW/SW setup and the type of user application:

- 1) The FIFO_CACHE is recommended for user applications able to request to the operating system a large amount of physical memory and that require making a large numbers of DEM computations per DEM area i.e. when several DEM computations are done reading the same file or small set of files covering the same region.
- 2) The PRELOAD_CACHE is recommended for multithreading applications. Note that memory holding DEM data can be shared amongst several threads. In the FIFO_CACHE, as memory content can change at runtime, mutual exclusion mechanisms are implemented in order to avoid threads to access inconsistent data. Such mechanisms are not needed in the PRELOAD_CACHE methods and therefore multithreading applications may run more efficiently. However the user is requested to estimate the area (in terms of the longitude/latitude boundaries) that will be requested during computations.

Date:

Issue: 10/05/2019

Page: 254

3) The above methods using memory to hold DEM data do not improve performance (or make even performance worse) of applications running with low amount of physical memory available or when DEM request is sporadic per DEM area. In all these cases, the user is recommended to set Cache_Type to NO_CACHE. For example, applications making sporadic accesses and in different DEM areas will not benefit of the caching methods, as the advantage of having a fast access to data is lost by the disadvantage of continuously load new files correspondent to different areas.

The default configuration is (i.e. when fields are not provided in the file):

- Cache Type = FIFO CACHE
- Cache Max Size = 2 GigaBytes

Values of Cache_Type and Cache_Max_Size can be changed at runtime under certain conditions using the function xp_dem_id_configure.

Memory is allocated using the malloc() C library function. Therefore performance of DEM access using caching strictly depends on the implementation of such library and on memory management from the Operating System. Performance of access to memory depends on many factors that can be tuned by the user. For the sake of example, if, as it normally happens in Linux systems, the memory request is larger than a given threshold size, the memory will be allocated in the virtual memory space and this may result in several page faults at runtime, leading to inefficiencies in the execution. The user can improve this by tuning the threshold size (i.e. using the mallopt() C library, if available). In order to get the best advantages from the caching methods, the user is therefore recommended to evaluate and tackle platform specific issues to memory allocation and management.

7.65.4 DEM maximum altitude algorithm

If the mini tile configuration is provided (MiniTile_Configuration tag) in the DEM configuration file (see [D_H_SUM]), the maximum altitude algoritm is used to compute DEM intersection. This algorithm consists in the following:

- The tiles are divided in sub-sections (mini-tiles), according to the configuration provided in DEM configuration file: Lon_Size and Lat_Size tags. For example, if the tile is 15 degrees long in longitude and 15 degrees long in latitude, and Lon_Size and Lat_Size are 5 degrees and 5 degrees respectively, the tile would have 9 mini-tiles equal in size between them.
- In the DEM configuration of mini-tiles, also the tag Filename is provided, which corresponds to the name (or path) of the binary file which contains the maximum altitude corresponding to each minitile. This file can be generated with function xp_gen_dem_max_altitude_file. If no path is provided, the binary file in looked for in current directory and the DEM directory.
- Internally, the algorithm checks if the altitude of the rays when crossing above each mini-tile is higher or lower than maximum altitude contained in the mini-tile. If the altitude is lower, the mini-tile is computed to look for an intersection; if not, the mini-tile is skipped and the following mini-tile is checked.

Note: the algorithm is not executed if the difference in latitude/longitude of start and end points in ray search is less than mini-tile size.

7.65.5 DEM Geoid computation

The DEM ACE2 and GDEM V2 files provide the altitude with respect to its reference geoid. In the internal DEM computations, the altitude is transformed to altitude over the reference ellipsoid. To perform this

Date:

Issue: 10/05/20 1/97

Page: 255

operation, a number of harmonics must be used, which can be configured with the following DEM configuration user tags (see [D_H_SUM]):

- Geoid Computation tag: this field can take the values:
 - "Enabled": geoid computation is performed.
 - "Disabled": geoid computation is not performed.
- Geoid Nof Harmonics tag: the number of harmonics to be used in geoid computation.

If this fields are not provided, the default values are:

- Geoid Computation: Enabled
- Geoid_Nof_Harmonics: 30

The computation precision increases with the number of harmonics (maximum is 360 harmonics) but the runtime performance gets worse. The computation of the geoid at runtime can be avoided by generating offline a DEM dataset storing altitudes w.r.t ellipsoid using xp_gen_dem_altitudes_from_ellipsoid function. In this case, when the DEM is used, the geoid computation shall be disabled in the DEM configuration file.

7.65.6 Calling Interface

The calling interface of the **xp dem init** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    long mode, model;
    char dem_file[XL_MAX_STR];
    xp_dem_id dem_id = {NULL};
    long ierr[XP_NUM_ERR_DEM_INIT], status;

    status = xp_dem_init(&mode, &model, dem_file, &dem_id, ierr);
}
```

The XP NUM ERR DEM INIT constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 256

7.65.7 Input Parameters

The **xp_dem_init** CFI function has the following input parameters:

Table 163: Input parameters of xp_dem_init function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
mode	long *	-	Digital Elevation Model initialization mode. This parameter has no effect in current implementation (the DEM type is taken from configuration file), but a warning will be raised if the value does not coincide with the one in configuration file.	-	Complete
model	long *	-	Digital Elevation Model initialization model (dummy in current implementation)	-	Complete
dem_file	char[]	-	File used for DEM initialization (See DEM Configuration file in [D_H_SUM])		Complete

It is possible to use enumeration values rather than integer values for some of the input arguments:

• DEM Initilization Mode: initialization mode (according to XD Dem model enum in [D H SUM])

7.65.8 Output Parameters

The output parameters of the **xp_dem_init** CFI function are:

Table 164: Output parameters of xp_dem_init

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
dem_id	xp_dem_id*	-	Structure that contains the DEM initialization.	-	-
ierr	long	-	Error vector	-	-

7.65.9 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_dem_init** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp_get_msg** (see [GEN_SUM]).

Date:

Issue: 10/05/2019

Page: 257

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_dem_init** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM])

Table 165: Error messages of xp_dem_init function

7.66 xp_dem_close

7.66.1 Overview

The **xp_dem_close** CFI function cleans up any memory allocation performed by the **xp_dem_init** functions.

7.66.2 Calling Interface

The calling interface of the **xp dem close** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    xp_dem_id dem_id = {NULL};
    long ierr[XP_NUM_ERR_DEM_CLOSE], status;

    status = xp_dem_close(&dem_id, ierr);
}
```

The XP NUM ERR DEM CLOSE constant is defined in the file explorer_pointing.h.

7.66.3 Input Parameters

The **xp dem close** CFI function has the following input parameters:

Table 166: Input parameters of xp_dem_close function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
dem_id	xp_dem_id*	-	Structure that contains the DEM initialization.	-	-

7.66.4 Output Parameters

The output parameters of the **xp_dem_close** CFI function are:

Table 167: Output parameters of xp_dem_close

C name	C type	Array	Description	Unit	Allowed Range
--------	--------	-------	-------------	------	---------------

7.67 xp_dem_compute

7.67.1 Overview

The **xp_dem_compute** CFI function compute the altitude over the see level for a point in the Earth. The altitude is calculated from the altitudes read from a digital elevation model (DEM).

7.67.2 Calling Interface

The calling interface of the **xp_dem_compute** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    xl_model_id model_id = {NULL};
    xp_dem_id dem_id = {NULL};
    long ierr[XP_NUM_ERR_DEM_COMPUTE], status;
    double lon, lat, alt;
    status = xp_dem_compute(&model_id, &dem_id, &lon, &lat, ierr);
}
```

The XP NUM ERR DEM COMPUTE constant is defined in the file explorer_pointing.h.

Date:

Issue: 10/05/20 197

Page: 262

7.67.3 Input Parameters

The **xp_dem_compute** CFI function has the following input parameters:

Table 169: Input parameters of xp_dem_compute function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
model_id	xl_model_id*	-	Model ID	-	-
dem_id	xp_dem_id*	-	Structure that contains the DEM initialization.	-	-
lon	double	-	Input longitude	degrees	[0, 360)
lat	double	-	Input latitude	degrees	[-90, 90]

7.67.4 Output Parameters

The output parameters of the **xp_dem_compute** CFI function are:

Table 170: Output parameters of xp_dem_compute

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
alt	double	-	Altitude	meters	-
ierr	long	-	Error vector	-	-

7.67.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_dem_compute** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_dem_compute** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 171: Error messages of xp_dem_compute function

7.68xp_dem_get_info

7.68.1 Overview

The **xp_dem_get_info** CFI function reads DEM information for a given geodetic point.

7.68.2 Calling Interface

The calling interface of the **xp_dem_get_info** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    xl_model_id model_id = {NULL};
    xp_dem_id dem_id = {NULL};
    long ierr[XP_NUM_ERR_DEM_GET_INFO], status;
    double lon, lat;
    xp_dem_info dem_info
    status = xp_dem_get_info(&model_id, &dem_id, &dem_id, &dem_info, &dem_inf
```

The XP NUM ERR DEM GET INFO constant is defined in the file explorer_pointing.h.

Date:

Issue: 10/05/20 197

Page: 264

7.68.3 Input Parameters

The **xp_dem_get_info** CFI function has the following input parameters:

Table 172: Input parameters of xp_dem_get_info function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
model_id	xl_model_id*	-	Model ID	-	-
dem_id	xp_dem_id*	-	Structure that contains the DEM initialization.	-	-
lon	double	-	Input longitude	degrees	[0, 360)
lat	double	-	Input latitude	degrees	[-90, 90]

7.68.4 Output Parameters

The output parameters of the xp dem get info CFI function are:

7.69 xp_dem_get_id_data

7.69.1 Overview

The xp_dem_get_id_data CFI function returns DEM initialization data.

7.69.2 Calling interface

The calling interface of the **xp_dem_get_id_data** CFI function is the following (input parameters are <u>underlined</u>):

7.69.3 Input parameters

The xp dem get id data CFI function has the following input parameters:

Table 175: Input parameters of xp_dem_get_id_data function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
dem_id	xp_dem_id *	-	Structure that contains the DEM initialization.	-	-

7.69.4 Output parameters

The output parameters of the xp dem get id data CFI function are:

Table 176: Output parameters of xp_dem_get_id_data function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xp_dem_get_id_data	long	-	Status flag	-	-
data	xp_dem_id_data	-	DEM initialization data	-	-

Date:

Issue: 10/05/2019

Page: 267

7.69.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

• The dem id was not initialised.

7.70 xp_dem_id_configure

7.70.1 Overview

The **xp_dem_id_configure** CFI function performs configuration operations on DEM cache. The following operations can be performed:

- CLEAR CACHE: all the tiles in the cache are unloaded but cache memory is not freed.
- FREE CACHE: all the tiles in the cache are unloaded and cache memory is freed.
- SET MAXIMUM CACHE SIZE: this operation can only be performed for FIFO cache. A new maximum size for cache is set. If there are more tiles loaded in cache than new maximum size, the tiles are unloaded in a FIFO (First in- First out) order till new maximum size is reached.
- LOAD TILE SET: this operation can only be performed for PRELOAD cache. A set of tiles corresponding to an input rectangular longitude-latitude area is loaded in cache.

7.70.2 Calling Interface

The calling interface of the **xp_dem_id_configure** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    xp_dem_id    dem_id = {NULL};
    long ierr[XP_NUM_ERR_DEM_ID_CONFIGURE], status;
    xp_dem_id_config config;

    status = xp_dem_id_configure(&dem_id, &config, ierr);
}
```

The XP_NUM_ERR_DEM_ID_CONFIGURE constant is defined in the file explorer_pointing.h.

Date:

Issue: 10/05/2019

Page: 268

7.70.3 Input Parameters

The **xp_dem_id_configure** CFI function has the following input parameters:

Table 177: Input parameters of xp_dem_id_configure function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
dem_id	xp_dem_id*	-	Structure that contains the DEM initialization.	-	-
config	xp_dem_id_co nfig	-	Input operation on cache	-	- Possible values for command field: XP_LOAD_TILE_SET XP_CLEAR_CACHE XP_FREE_CACHE XP_SET_MAX_SIZE - For rectangular area: 0. ≤ longitude ≤ 360. -90. ≤ latitude ≤ 90.

7.70.4 Output Parameters

The output parameters of the **xp_dem_id_configure** CFI function are:

Table 178: Output parameters of xp_dem_id_configure

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
xp_dem_id _configure	long	-	Status flag	-	-
ierr	long	-	Error vector	-	-

7.70.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_dem_id_configure** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

Date:

Issue: 10/05/2019

Page: 269

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_dem_id_configure** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 179: Error messages of xp_dem_get_info function

Error type	Error message	Cause and impact	Error code	Error No
ERR	DEM id configured without cache	No calculation performed	XD_CFI_DEM_ID_CONFIGUR E_NO_CACHE_ERR	0
ERR	Wrong configuration command provided	No calculation performed	XD_CFI_DEM_ID_CONFIGUR E_WRONG_COMMAND_ERR	1
ERR	Error allocating memory	No calculation performed	XD_CFI_DEM_ID_CONFIGUR E_MEMORY_ERR	2
ERR	Error in input longitudes	No calculation performed	XD_CFI_DEM_ID_CONFIGUR E_LON_ERR	3
ERR	Error in input latitudes	No calculation performed	XD_CFI_DEM_ID_CONFIGUR E_LAT_ERR	4
ERR	Requested area needs more memory than maximum cache size	No calculation performed	XD_CFI_DEM_ID_CONFIGUR E_MAX_CACHE_ERR	5
ERR	Error loading tile	No calculation performed	XD_CFI_DEM_ID_CONFIGUR E_LOAD_TILE_ERR	6
ERR	Error locking thread	No calculation performed	XD_CFI_DEM_ID_CONFIGUR E_LOCK_THREAD_ERR	7

Date:

Issue: 10/05/20 197

Page: 270

7.71 xp_dem_get_cell_value

7.71.1 Overview

The **xp_dem_get_cell_value** CFI function retrives the altitude value for the corresponding DEM and the given row and column.

The altitude value returned by the function is the value stored in the corresponding DEM file (without any processing of the value). Note that some DEM's can give this value as the altitude over the ellipsoid while others give the altitude over the geoid.

The row/column value refers to the number of row/column considering a DEM covering the whole Earth.

This way, row 0 corresponds to the first row in DEM that gives the altitudes at latitude 90deg south and the last row will contain the altitudes at latitude 90deg north.

The column 0 corresponds to the altitudes for longitude 0 deg while the last column refers to the altitudes at longitude 360 deg.

The total number of rows/columns can be get with the function **xp_dem_get_id_data** (the returned structure contains these numbers: **xp_dem_id_data.dem_metadata.n_rows** and **xp_dem_id_data.dem_metadata.n_cols**). Note that the total number of rows/columns of the DEM is related to the DEM resolution as follows:

```
number of rows = 180deg / (resolution along latitude axis)
```

number of columns = 360deg / (resolution along latitude axis)

For instance, a DEM with a resolution of 30 arcsecond:

```
number of rows = 180 \text{deg} / (30/3600) = 21600
```

number of columns = 360 deg / (30/3600) = 43200

7.71.2 Calling Interface

The calling interface of the **xp_dem_get_cell_value** CFI function is the following (input parameters are underlined):

```
#include <explorer_pointing.h>
{
    xp_dem_id    dem_id = {NULL};
    long ierr[XP_NUM_ERR_DEM_GET_CELL_VALUE], status;
    long row;
    long column;
    double value;

status = xp_dem_get_cell_value(&dem_id, row, column, &value, ierr);
```

Date:

Issue: 10/05/2<u>Q</u>.1197

Page: 271

}

The XP_NUM_ERR_DEM_GET_CELL_VALUE constant is defined in the file explorer_pointing.h.

Date:

Issue: 10/05/2019

Page: 272

7.71.3 Input Parameters

The xp_dem_get_cell_value CFI function has the following input parameters:

Table 180: Input parameters of xp_dem_get_cell_value function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
dem_id	xp_dem_id*	-	Structure that contains the DEM initialization.	-	-
row	long	-	DEM row number	-	.>=0 < total number of rows in DEM (see total number of rows/ columns)
column	long	-	DEM column number	-	>=() < total number of columns in DEM (see total number of rows/ columns)

7.71.4 Output Parameters

The output parameters of the **xp dem get cell value** CFI function are:

Table 181: Output parameters of xp_dem_get_cell_value

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
value	double*	-	Altitude in DEM	m	-
ierr	long*	-	Error vector	-	-

7.71.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_dem_get_cell_value** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_dem_get_cell_value** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Date:

Issue: 10/05/2019

Page: 273

Table 182: Error messages of xp_dem_get_cell_value function

Error type	Error message	Cause and impact	Error code	Error No
ERR	Error reading DEM point from file: %s	No calculation performed	XP_CFI_DEM_GET_CELL_VAL UE_READ_POINT_ERR	0

7.72 xp_dem_get_cell_geod

7.72.1 Overview

The **xp_dem_get_cell_geod** CFI function retrives the geodetic point (latitude/longitude) for the corresponding DEM for the given row and column.

The row/column value refers to the number of row/column considering a DEM covering the whole Earth (see details in section 7.71.1)

7.72.2 Calling Interface

The calling interface of the **xp_dem_get_cell_geod** CFI function is the following (input parameters are <u>underlined</u>):

The XP NUM ERR DEM GET CELL GEOD constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 275

7.72.3 Input Parameters

The **xp_dem_get_cell_geod** CFI function has the following input parameters:

Table 183: Input parameters of xp_dem_get_cell_geod function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
dem_id	xp_dem_id*	-	Structure that contains the DEM initialization.	-	-
row	long	-	DEM row number	-	.>=0 < total number of rows in DEM (see total number of rows/columns)
column	long	-	DEM column number	-	>=0 < total number of columns in DEM (see total number of rows/columns)

7.72.4 Output Parameters

The output parameters of the **xp** dem get cell geod CFI function are:

Table 184: Output parameters of xp_dem_get_cell_geod

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
lat	double*	-	latitude corresponding to the input row/column	deg	[-90, 90]
lon	double*	-	longitudecorresponding to the input row/column	deg	[0, 360]
ierr	long*	-	Error vector	-	-

7.72.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_dem_get_cell_geod** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

Date:

Issue: 10/05/2019

Page: 276

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_dem_get_cell_geod** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 185: Error messages of xp_dem_get_cell_geod function

Issue: 10/05/2019

Page: 277

7.73 xp_target_inter

7.73.1 Overview

The **xp_target_inter** CFI function computes the first or the second intersection point of the line of sight from the satellite (defined by an elevation and an azimuth angle expressed in the selected Attitude Frame) with a surface located at a certain geodetic altitude over the Earth.

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.73.2 Calling Interface

The calling interface of the **xp_target_inter** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>
{
                    sat id;
    long
    xp attitude id attitude id = {NULL};
    xp atmos id
                    atmos id = {NULL};
    xp dem id
                    dem id = {NULL};
                   target id = {NULL};
    xp target id
    long deriv, inter flag, iray;
    double los az, los_el, geod_alt, los_az_rate, los_el_rate, freq;
    long ierr[XP NUM ERR TARGET INTER], status, num user target,
        num los target;
    status = xp target inter(&sat id,
              &attitude id,
              &atmos id,
              &dem id,
              &deriv, &inter flag, &los az, &los el, &geod alt,
              &los az rate, &los el rate, &iray, &freq,
              &num user target, &num los target,
              &target id, ierr);
    /* Or, using the run id */
    long run id;
    status = xp target inter run(&run id,
```

}

Code: EO-MA-DMS-GS-0005

Date:

Issue: 10/05/2019

Page: 278

&attitude_id,
&deriv, &inter_flag, &los_az, &los_el, &geod_alt,
&los_az_rate, &los_el_rate, &iray, &freq,
&num_user_target, &num_los_target,

&target id, ierr);

The $\texttt{XP_NUM_ERR_TARGET_INTER}$ constant is defined in the file $explorer_pointing.h.$

Date:

Issue: 10/05/2<u>0</u>19

Page: 279

7.73.3 Input Parameters

The **xp_target_inter** CFI function has the following input parameters:

Table 186: Input parameters of xp_target_inter function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_id	long *	-	Satellite ID	-	Complete
attitude_id	xp_attitude_id*	-	Structure that contains the Attitude. (input/output)	-	-
atmos_id	xp_atmos_id*	-	Structure that contains the atmosphere initialization.	-	The atmos_id has to be initialized with any of these modes: - XP_NO_REF_INIT - XP_STD_INIT - XP_USER_INIT
dem_id	xp_dem_id*	-	Structure that contains the DEM initialization.	-	-
deriv	long *	-	Derivative ID	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
inter_flag	long *	-	Flag for first or second inter section point selection	-	Allowed values: (1) XP_INTER_1ST (2) XP_INTER_2ND
los_az	double *	-	Azimuth of the LOS (Attitude Frame)	deg	>= 0 < 360
los_el	double *	-	Elevation of the LOS (Attitude Frame)	deg	>= -90 <= 90
geod_alt	double *	-	Geodetic altitude over the Earth	m	>= -bWGS
los_az_rate	double *	-	Azimuth-rate of the LOS (Attitude Frame)	deg/s	-
los_el_rate	double *	-	Elevation-rate of the LOS (Attitude Frame)	deg/s	-
iray	long *	-	Not used. The atmosphere refraction model can be defined via atmos_id initialization. If iray is different of XP_NO_REF_INIT, a warning is raised.	-	-

Date:

Issue: 10/05/20 197

Page: 280

freq double *	-	Frequency of the signal	Hz	>= 0
---------------	---	-------------------------	----	------

It is possible to use enumeration values rather than integer values for some of the input arguments:

- Derivative switch: deriv. See current document, Table 3.
- Intersection flag: inter flag. See current document, Table 3.

•

7.73.4 Output Parameters

The output parameters of the **xp_target_inter** CFI function are:

Table 187: Output parameters of xp_target_inter

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
num_user_t arget	long*	-	Number of user defined targets calculated	-	>= 0 (Set to 1 for non multi-target routines)
num_los_tar get	long*	-	Number of LOS targets calculated	-	>= 0
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
ierr	long	-	Error vector	-	-

7.73.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_inter** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp_get_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_inter** function by calling the function of the EO_POINTING software library **xp get code** (see [GEN SUM]).

Table 188: Error messages of xp_target_inter function

7.74 xp_target_ground_range

7.74.1 Overview

The **xp_target_ground_range** CFI function computes the location of a point that is placed on a surface at a certain geodetic altitude over the Earth, that lays on the plane defined by the satellite position, the nadir and a reference point, and that is at a certain distance or ground range measured along that surface from that reference point.

This reference point is calculated being the intersection of the previous surface with the line of sight defined by an elevation and azimuth angle in the selected Attitude Frame.

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.74.2 Calling Interface

The calling interface of the **xp_target_ground_range** CFI function is the following (input parameters are underlined):

```
#include <explorer pointing.h>
{
    long
                    sat id;
    xp attitude id attitude id = {NULL};
    xp dem id
                    dem id = {NULL};
                    target id = {NULL};
    xp target id
    long deriv;
    double los az, los el, geod alt, distance;
    double los az rate, los_el_rate;
    long ierr[XP NUM ERR TARGET GROUND RANGE], status,
             num user target, num los target;
    status = xp target ground range (&sat id,
              &attitude id,
              &dem id,
              &deriv, &los az,
              &los el, &geod alt, &distance, &los az rate,
              &los el rate, &num user target, &num los target,
              &target id, ierr);
    /* Or, using the run id */
    long run id;
```

Date:

Issue: 10/05/2\(\right)\frac{1}{2}\(\right)\right)\frac{1}{2}\(\right)\frac{1}{2}\(\ri

Page: 283

The XP_NUM_ERR_TARGET_GROUND_RANGE constant is defined in the file explorer_pointing.h.

Issue: 10/05/2019

Page: 284

7.74.3 Input Parameters

The xp_target_ground_range CFI function has the following input parameters:

Table 189: Input parameters of xp_target_ground_range function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_id	long *	-	Satellite ID	-	Complete
attitude_id	xp_attitude_id*	-	Structure that contains the Attitude. (input/output)	-	-
dem_id	xp_dem_id*	-	Structure that contains the DEM initialization.	-	-
deriv	long *	-	Derivative ID	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
los_az	double *	-	Azimuth of the LOS (Attitude Frame)	deg	>= 0 < 360
los_el	double *	-	Elevation of the LOS (Attitude Frame)	deg	>= -90 <= 90
geod_alt	double *	-	Geodetic altitude over the Earth (Earth fixed CS)	m	>= -bWGS
distance	double *	-	Distance or ground range to the reference point, positive from nadir in the azimuth direction (Earth Fixed CS)	m	-
los_az_rate	double *	-	Azimuth-rate of the LOS (Attitude Frame)	deg/s	-
los_el_rate	double *	-	Elevation-rate of the LOS (Attitude Frame)	deg/s	-

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Derivative switch: deriv. See current document, Table 3.

Date:

Issue: 10/05/2019

Page: 285

7.74.4 Output Parameters

The output parameters of the xp_target_ground_range CFI function are:

Table 190: Output parameters of xp_target_ground_range

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
num_user_t arget	long*	-	Number of user defined targets calculated	-	>= 0 (Set to 1 for non multi-target routines)
num_los_tar get	long*	-	Number of LOS targets calculated	-	>= 0
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
ierr	long	-	Error vector	-	-

7.74.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_ground_range** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp_get_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_ground_range** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 191: Error messages of xp_target_ground_range function

7.75 xp_target_incidence_angle

7.75.1 Overview

The **xp_target_incidence_angle** CFI function computes the location of a point that is placed on a surface at a certain geodetic altitude over the Earth and that is seen from the satellite on a line of sight that forms a certain azimuth angle in the selected Attitude Frame and that intersects that surface with a certain incidence angle.

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.75.2 Calling Interface

The calling interface of the **xp_target_incidence_angle** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>
    long
                   sat id, deriv;
    xp attitude id attitude id = {NULL};
                   dem id = {NULL};
    xp dem id
    xp target id
                   target id = {NULL};
    double los az, inc angle, geod alt, los az rate;
    long ierr[XP NUM ERR TARGET INCIDENCE ANGLE], status,
             num user target, num los target;
    status = xp target incidence angle (&sat id,
                  &attitude id, &dem id,
                  &deriv, &los az,
                  &inc angle, &geod alt, &los az rate,
                  &num user target, &num los target,
                  &target id, ierr);
    /* Or, using the run id */
    long run id;
    status = xp target incidence angle run(&run id, &attitude id,
                  &deriv, &los az,
                  &inc angle, &geod alt, &los az rate,
                  &num user target, &num los target,
```

Date:

Issue: 10/05/2019

Page: 288

&target_id, ierr);

The XP NUM ERR TARGET INCIDENCE ANGLE constant is defined in the file explorer_pointing.h.

Date:

Issue: 10/05/2019

Page: 289

7.75.3 Input Parameters

The **xp_target_incidence_angle** CFI function has the following input parameters:

Table 192: Input parameters of xp_target_incidence_angle function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_id	long *	-	Satellite ID	-	Complete
attitude_id	xp_attitude _id*	-	Structure that contains the Attitude. (input/output)	-	-
dem_id	xp_dem_id	-	Structure that contains the DEM initialization.	-	-
deriv	long *	-	Derivative ID	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
los_az	double *	-	Azimuth of the LOS (Attitude Frame)	deg	>= 0 < 360
inc_angle	double *	-	Incidence angle of the LOS (Earth fixed CS)	deg	>= 0 <= 90
geod_alt	double *	-	Geodetic altitude over the Earth (Earth fixed CS)	m	>= -bWGS
los_az_rate	double *	-	Azimuth-rate of the LOS (Attitude Frame)	deg/s	-

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Derivative switch: deriv. See current document, Table 3.

Date:

Issue: 10/05/20 197

Page: 290

7.75.4 Output Parameters

The output parameters of the xp_target_incidence_angle CFI function are:

Table 193: Output parameters of xp_target_incidence_angle

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
num_user_t arget	long*	-	Number of user defined targets calculated	-	>= 0 (Set to 1 for non multi-target routines)
num_los_tar get	long*	-	Number of LOS targets calculated	-	>= 0
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
ierr	long	-	Error vector	-	-

7.75.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_incidence_angle** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_incidence_angle** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 194: Error messages of xp_target_incidence_angle function

Error type	Error message	Cause and impact	Error code	Error No

7.76 xp_target_range

7.76.1 Overview

The **xp_target_range** CFI function computes the location of a point that is placed on a surface at a certain geodetic altitude over the Earth, that is seen from the satellite on a line of sight that forms a certain azimuth angle in the selected Attitude Frame, and that is at a certain range or slant-range from the satellite. If more than one target is found, the first one will be the one with an elevation closer to 90 degrees (targets will have the same azimuth, equal to input azimuth).

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.76.2 Calling Interface

The calling interface of the **xp_target_range** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>
    long
                    sat id;
    xp attitude id attitude id = {NULL};
    xp dem id
                   dem id = {NULL};
                   target id = {NULL};
    xp target id
    long deriv;
    double los az, range, geod alt, los az rate, range rate;
    long ierr[XP NUM ERR TARGET_RANGE], status, num_user_target,
             num los target;
    status = xp target range (&sat id, &attitude id, &dem id,
                  &deriv, &los az, &range,
                  &geod alt, &los az rate, &lrange rate,
                   &num user target, &num los target,
                   &target id, ierr);
    /* Or, using the run id */
    long run id;
    status = xp target range run(&run id, &attitude id,
                  &deriv, &los az, &range,
                  &geod alt, &los az rate, &lrange rate,
                   &num user target,
                                                 &num los target,
```

7.77 xp_target_range_rate

7.77.1 Overview

The **xp_target_range_rate** CFI function computes the location of a point that is placed on a surface at a certain geodetic altitude over the Earth, that is at a certain range from the satellite, and this range has a certain change rate (range rate). Associated Earth-fixed target is supposed to have zero range-rate value.

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.77.2 Calling Interface

The calling interface of the **xp_target_range_rate** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>
{
                    sat id;
    long
    xp attitude id attitude id = {NULL};
                   dem id = {NULL};
    xp dem id
                   target id = {NULL};
    xp target id
    long deriv;
    double ef range rate, range, geod alt;
    double ef range rate rate, range rate;
    long ierr[XP NUM ERR TARGET RANGE RATE], status, num user target,
             num los target;
    status = xp target range rate(&sat id,
              &attitude id,
              &dem id,
              &deriv, &ef range rate, &range,
              &geod alt, &ef range rate rate, &range rate,
              &num user target, &num los target, &target id, ierr);
    /* Or, using the run id */
    long run id;
    status = xp target range rate run (&run id,
              &attitude id,
              &deriv, &ef range rate, &range,
```

}

Code: EO-MA-DMS-GS-0005

7.78 xp_target_tangent

7.78.1 Overview

The **xp_target_tangent** CFI function computes the location of the tangent point over the Earth that is located on the line of sight defined by an elevation and azimuth angles expressed in the selected Attitude Frame.

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.78.2 Calling Interface

The calling interface of the **xp_target_tangent** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>
{
                    sat id;
    long
    xp attitude id attitude id = {NULL};
    xp atmos id
                   atmos id = {NULL};
    xp dem id
                   dem id = {NULL};
    xp target id
                   target id = {NULL};
    long deriv,
                      iray;
    double los_az, los_el, los_az_rate, los_el_rate, freq;
    long ierr[XP NUM ERR TARGET TANGENT], status, num user target,
        num los target;
    status = xp target tangent(&sat id, &attitude id,
                              &dem id,
                  &atmos id,
                  &deriv, &los az, &los el,
                  &los az rate, &los el rate, &iray, &freq,
                  &num user target, &num los target,
                  &target id, ierr);
    /* Or, using the run id */
    long run id;
    status = xp target tangent run(&run id, &attitude id,
                  &deriv, &los az, &los el,
                  &los az rate, &los el rate, &iray, &freq,
```

Date:

Issue: 10/05/2<u>Q</u>.1197

Page: 303

```
&num_user_target, &num_los_target,
&target_id, ierr);
```

The XP_NUM_ERR_TARGET_TANGENT constant is defined in the file explorer_pointing.h.

Issue: 10/05/2019

Page: 304

7.78.3 Input Parameters

The xp_target_tangent CFI function has the following input parameters:

Table 201: Input parameters of xp_target_tangent function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_id	long *	-	Satellite ID	-	Complete
attitude_id	xp_attitude _id*	-	Structure that contains the Attitude. (input/output)	-	-
atmos_id	xp_atmos_ id*	-	Structure that contains the atmosphere initialization.	-	-
dem_id	xp_dem_id	-	Structure that contains the DEM initialization.	-	-
deriv	long *	-	Derivative ID	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
los_az	double *	-	Azimuth of the LOS (Attitude Frame)	deg	>= 0 < 360
los_el	double *	-	Elevation of the LOS (Attitude Frame)	deg	>= -90 <= 90
los_az_rate	double *	-	Azimuth-rate of the LOS (Attitude Frame)	deg/s	-
los_el_rate	double *	-	Elevation-rate of the LOS (Attitude Frame)	deg/s	-
iray	long *	-	Not used. The atmosphere refraction model can be defined via atmos_id initialization.	-	-
freq	double *	-	Frequency of the signal	Hz	>= 0

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Derivative switch: deriv. See current document, Table 3.

Date:

Issue: 10/05/2019

Page: 305

7.78.4 Output Parameters

The output parameters of the xp_target_tangent CFI function are:

Table 202: Output parameters of xp_target_tangent

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
num_user_t arget	long*	-	Number of user defined targets calculated	-	>= 0 (Set to 1 for non multi-target routines)
num_los_tar get	long*	-	Number of LOS targets calculated	-	>= 0
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
ierr	long	-	Error vector	-	-

7.78.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_tangent** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp_get_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_tangent** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

7.79 xp_target_altitude

7.79.1 Overview

The **xp_target_altitude** CFI function computes the location of the tangent point over the Earth that is located on a surface at a certain geodetic altitude over the Earth and that is on a line of sight that forms a certain azimuth angle in the selected Attitude Frame.

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.79.2 Calling Interface

The calling interface of the **xp_target_altitude** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>
{
                    sat id;
    long
    xp attitude id attitude id = {NULL};
    xp atmos id
                    atmos id = {NULL};
    xp dem id
                    dem id = {NULL};
    xp target id
                    target id = {NULL};
    long deriv,
                      iray;
    double los_az, geod_alt, los_az_rate, freq;
    long ierr[XP NUM ERR TARGET ALTITUDE], status, num user target,
             num los target;
    status = xp target altitude (sat id, &attitude id,
              &atmos id, &dem id,
              &deriv, &los az, &geod alt,
              &los az rate, &iray, &freq,
              &num user target, &num los target,
              &target id, ierr);
    /* Or, using the run id */
    long run id;
    status = xp target altitude run(run id, &attitude id,
              &deriv, &los az, &geod alt,
              &los az rate, &iray, &freq,
```

7.79.3 Input Parameters

The xp_target_altitude CFI function has the following input parameters:

Table 204: Input parameters of xp_target_altitude function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_id	long *	-	Satellite ID	-	Complete
attitude_id	xp_attitude _id*	-	Structure that contains the Attitude. (input/output)	-	-
atmos_id	xp_atmos_ id*	-	Structure that contains the atmosphere initialization.	-	-
dem_id	xp_dem_id	-	Structure that contains the DEM initialization.	-	-
deriv	long *	-	Derivative ID	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
los_az	double *	-	Azimuth of the LOS (Attitude Frame)	deg	>= 0 < 360
geod_alt	double *	-	Geodetic altitude over the Earth	m	>= -bWGS
los_az_rate	double *	-	Azimuth-rate of the LOS (Attitude Frame)	deg/s	-
iray	long *	-	Not used. The atmosphere refraction model can be defined via atmos_id initialization.	-	-
freq	double *	-	Frequency of the signal	Hz	>= 0

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Derivative switch: deriv. See current document, Table 3.

Date:

Issue: 10/05/2019

Page: 310

7.79.4 Output Parameters

The output parameters of the xp_target_altitude CFI function are:

Table 205: Output parameters of xp_target_altitude

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
num_user_t arget	long*	-	Number of user defined targets calculated	-	>= 0 (Set to 1 for non multi-target routines)
num_los_tar get	long*	-	Number of LOS targets calculated	-	>= 0
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
ierr	long	-	Error vector	-	-

7.79.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_altitude** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp_get_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_altitude** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 206: Error messages of xp_target_altitude function

Error type	Error message	Cause and impact	Error code	Error No

7.80 xp_target_star

7.80.1 Overview

The **xp_target_star** CFI function computes the location of the tangent point over the Earth that is located on the line of sight that points to a star defined by its right ascension and declination coordinates.

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.80.2 Calling Interface

The calling interface of the xp_target_star CFI function is the following (input parameters are underlined):

```
#include <explorer pointing.h>
                    sat id;
    long
    xp attitude id attitude id = {NULL};
                    atmos id = {NULL};
    xp atmos id
                    dem id = {NULL};
    xp dem id
    xp target id
                   target id = {NULL};
    long deriv, iray;
    double star ra, star dec, star ra rate, star dec rate, freq;
    long ierr[XP NUM ERR TARGET STAR], status, num user target,
             num los target;
    status = xp target star(&sat id, &attitude id,
              &atmos id, &dem id,
              &deriv, &star ra, star dec,
              &star ra rate, &star dec rate, &iray, &freq,
              &num user target, &num los target,
              &target id, ierr);
    /* Or, using the run id */
    long run id;
    status = xp target star run(&run id, &attitude id,
              &deriv, &star ra, star dec,
              &&star ra rate, &star dec rate, &iray, &freq,
              &num user target, &num los target,
              &target id, ierr);
```

7.80.3 Input Parameters

The **xp_target_star** CFI function has the following input parameters:

Table 207: Input parameters of xp_target_star function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_id	long *	-	Satellite ID	-	Complete
attitude_id	xp_attitude _id*	-	Structure that contains the Attitude. (input/output)	-	-
atmos_id	xp_atmos_ id*	-	Structure that contains the atmosphere initialization.	-	-
dem_id	xp_dem_id	-	Structure that contains the DEM initialization.	-	-
deriv	long *	-	Derivative ID	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
star_ra	double *	-	Right ascension of the star (True of Date CS)	deg	>= 0 < 360
star_dec	double *	-	Declination of the star (True of Date CS)	deg	>= -90 <= +90
star_ra_rate	double *	-	Right ascension rate of the star (True of Date CS)	deg/s	-
star_dec_rate	double *	-	Declination rate of the star (True of Date CS)	deg/s	-
iray	long *	-	Not used. The atmosphere refraction model can be defined via atmos_id initialization.	-	-
freq	double *	-	Frequency of the signal	Hz	>= 0

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Derivative switch: deriv. See current document, Table 3.

Date:

Issue: 10/05/2019

Page: 315

7.80.4 Output Parameters

The output parameters of the xp_target_star CFI function are:

Table 208: Output parameters of xp_target_star

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
num_user_t arget	long*	-	Number of user defined targets calculated	-	>= 0 (Set to 1 for non multi-target routines)
num_los_tar get	long*	-	Number of LOS targets calculated	-	>= 0
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
ierr	long	-	Error vector	-	-

7.80.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_star** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp_get_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_star** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 209: Error messages of xp_target_star function

7.81 xp_target_station

7.81.1 Overview

The **xp_target_station** CFI function computes the most relevant observation parameters of the link between the satellite and a ground station.

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.81.2 Calling Interface

The calling interface of the **xp_target_station** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>
    long
                    sat id;
    xp attitude id attitude id = {NULL};
                   dem id = {NULL};
    xp dem id
    xp target id
                    target id = {NULL};
    long deriv;
    double geoc long, geod lat, geod alt, min link el;
    long ierr[XP NUM ERR TARGET STATION], status, num user target,
             num los target;
    status = xp target station(&sat id,
              &attitude id, &dem id,
              &deriv, &geoc long, &geod lat,
              &geod alt, &min link el,
              &num user target, &num los target,
              &target id, ierr);
    /* Or, using the run id */
    long run id;
    status = xp target station run(&run id,
              &attitude id,

7.82 xp_target_generic

7.82.1 Overview

The **xp_target_generic** CFI function allows the user to provide the target location (position and velocity) and later calculate extra results from it.

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.82.2 Calling Interface

The calling interface of the **xp_target_generic** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>
    long
                    sat id;
    xp attitude id attitude id = {NULL};
                   dem id = {NULL};
    xp dem id
    xp target id
                    target id = {NULL};
    long deriv;
    double targ pos[3], targ_vel[3], targ_acc[3];
    long ierr[XP NUM ERR TARGET GENERIC], status, num user target,
             num los target;
    status = xp target generic(&sat id,
              &attitude id,
              &dem id,
              &deriv, targ pos, targ vel, targ acc,
              &num user target, &num los target,
              &target id, ierr);
    /* Or, using the run id */
    long run id;
    status = xp target generic run(&run id,
              &attitude id,
              &deriv, targ pos, targ vel, targ acc,
              &num user target, &num los target,
              &target id, ierr);
```

Date:

Issue: 10/05/2019

Page: 323

}

The XP NUM ERR TARGET GENERIC constant is defined in the file explorer_pointing.h.

7.82.3 Input Parameters

The **xp_target_generic** CFI function has the following input parameters:

Table 213: Input parameters of xp_target_generic function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_id	long *	-	Satellite ID	-	Complete
attitude_id	xp_attitude _id*	-	Structure that contains the Attitude. (input/output)	-	-
dem_id	xp_dem_id	-	Structure that contains the DEM initialization.	-	-
deriv	long *	-	Derivative ID	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
targ_pos	double[3]	[0-2]	Target position vector (Earth Fixed CS)	m	-
targ_vel	double[3]	[0-2]	Target velocity vector (Earth Fixed CS)	m/s	-
targ_acc	double[3]	[0-2]	Target acceleration vector (Earth Fixed CS)	m/s2	-

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Derivative switch: deriv. See current document, Table 3.

7.82.4 Output Parameters

The output parameters of the **xp_target_generic** CFI function are:

Table 214: Output parameters of xp_target_generic

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
num_user_t arget	long*	-	Number of user defined targets calculated	-	>= 0 (Set to 1 for non multi-target routines)

7.83 xp_target_reflected

7.83.1 Overview

The **xp_target_reflected** CFI function allows the user to compute, from S/C position and attitude, and emitting source position, the point of reflection from the source towards the SC at a certain geodetic altitude.

Note: in some limit configurations the function will return a degraded solution (returning also a warning of type XP_CFI_TARGET_REFLECTED_DEGRADED_SOL_WARN), where a maximum difference between the incidence angle and the reflected angle can be up to 5 milidegrees.

7.83.2 Calling Interface

The calling interface of the **xp_target_reflected** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>

```
&num_user_target, &num_los_target,
&target_id, ierr);
```

The XP NUM ERR TARGET GENERIC constant is defined in the file explorer_pointing.h.

7.83.3 Input Parameters

The **xp_target_reflected** CFI function has the following input parameters:

Table 216: Input parameters of xp_target_reflected function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_id	long *	-	Satellite ID	-	Complete
attitude_id	xp_attitude _id*	-	Structure that contains the Attitude. (input/output)	-	-
deriv	long *	-	Derivative ID	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
geod_lat	double *	-	GS geodetic latitude (Earth fixed CS)	deg	>= -90 <= 90
deflection_nort	double *	-	North-South component of the vertical deflection	deg	>= -90 < = 90
deflection_east	double *	-	East-West component of the vertical deflection	deg	>= -90 <= 90
source_type	long *	-	The type of source	-	Allowed values: XP_SOURCE_STAR XP_SOURCE_SUN XP_SOURCE_MOON XP_SOURCE_GENE RIC
source param	double[XP_ NUM_SOU RCE_PAR AM]	[0-5]	 if source_type is XP_SRC_STAR is selected, source_param = [ra (deg), dec (deg), paral lax, 0.0, 0.0, 0.0], i.e. star coordinates in BM2000 CS. if source_type is XP_SOURCE_GENERI C source_param = [x, y, z, vx,vy,vz] position and velocity in EF else dummy values. 	Right ascension and decli nation in degrees. Position vector in meters, velocity in meters/ second	-

Date:

Issue: 10/05/2019

Page: 327

It is possible to use enumeration values rather than integer values for some of the input arguments:

- Derivative switch: deriv. See current document, Table 3.
- Source Identification: source type. See current document, Table 3.

7.83.4 Output Parameters

The output parameters of the **xp_target_reflected** CFI function are:

Table 217: Output parameters of xp_target_reflected

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
num_user_t arget	long*	-	Number of user defined targets calculated	-	>= 0 (Set to 1 for non multi-target routines)
num_los_tar get	long*	-	Number of LOS targets calculated	-	>= 0
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
ierr	long	-	Error vector	-	-

7.83.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_reflected** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_reflected** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 218: Error messages of xp_target_reflected function

Error type	Error message	Cause and impact	Error code	Error No

7.84 xp_target_travel_time

7.84.1 Overview

The **xp_target_travel_time** CFI function computes the point of the line or sight from the satellite (defined by an elevation and an azimuth angle expressed in the selected Attitude Frame) at a given travel time along the (curved) line of sight.

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.84.2 Calling Interface

The calling interface of the **xp_target_travel_time** CFI function is the following (input parameters are underlined):

```
#include <explorer pointing.h>
{
                    sat id;
    long
    xp attitude id attitude id = {NULL};
    xp atmos id
                    atmos id = {NULL};
    xp dem id
                    dem id = {NULL};
    xp target id
                    target id = {NULL};
    long deriv, iray;
    double los az, los el, travel time
    double los az rate, los el rate, travel time rate, freq;
    long ierr[XP NUM ERR TARGET TRAVEL TIME], status,
             num user target, num los target;
    status = xp target travel time(&sat id,
              &attitude id,
              &atmos id,
              &dem id,
              &deriv, &los az,
              &los el, &travel time, &los az rate, &los el rate,
              &travel time rate, &iray, &freq,
              &num user target, &num los target,
              &target id, ierr);
    /* Or, using the run_id */
    long run id;
```

Date:

Issue: 10/05/2019

7.84.3 Input Parameters

The **xp_target_travel_time** CFI function has the following input parameters:

Table 219: Input parameters of xp_target_travel_time function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_id	long *	-	Satellite ID	-	Complete
attitude_id	xp_attitude _id*	-	Structure that contains the Attitude. (input/output)	-	-
atmos_id	xp_atmos_ id*	-	Structure that contains the atmosphere initialization.	-	The atmos_id has to be initialized with any of these modes: - XP_NO_REF_INIT - XP_STD_INIT - XP_USER_INIT
dem_id	xp_dem_id	-	Structure that contains the DEM initialization.	-	-
deriv	long *	-	Derivative ID	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
los_az	double *	-	Azimuth of the LOS (Attitude Frame)	deg	>= 0 < 360
los_el	double *	-	Elevation of the LOS (Attitude Frame)	deg	>= -90 <= 90
travel_time	double *	-	Travel time along the (curved) line of sight	S	> 0
los_az_rate	double *	-	Azimuth-rate of the LOS (Attitude Frame)	deg/s	-
los_el_rate	double *	-	Elevation-rate of the LOS (Attitude Frame)	deg/s	-
travel_time_rat e	double *	-	Travel time-rate along the (curved) line of sight	s/s	-
iray	long *	-	Not used. The atmosphere refraction model can be defined via atmos_id initialization.	-	-
freq	double *	-	Frequency of the signal	Hz	>= 0

It is possible to use enumeration values rather than integer values for some of the input arguments:

Date:

Issue: 10/05/2019

Page: 333

• Derivative switch: deriv. See current document, Table 3.

7.84.4 Output Parameters

The output parameters of the **xp** target travel time CFI function are:

Table 220: Output parameters of xp_target_travel_time

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
num_user_t arget	long*	-	Number of user defined targets calculated	-	>= 0 (Set to 1 for non multi-target routines)
num_los_tar get	long*	-	Number of LOS targets calculated	-	>= 0
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
ierr	long	-	Error vector	-	-

7.84.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_travel_time** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_travel_time** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 221: Error messages of xp_target_travel_time function

Error type	Error message	Cause and impact	Error code	Error No

7.85 xp_target_tangent_sun

7.85.1 Overview

The **xp_target_tangent_sun** CFI function computes the location of the tangent point over the Earth that is located on the line of sight that points to the Sun.

Note: a correction can be applied in order to compensate the travel time of Sun light travel time. This correction is not applied with default model. To activate this correction, the Sun model in xl_model_id must be initialized with the enum XL_MODEL_SUN_TRAVEL_TIME using the function xl_model_init (see [LIB SUM]).

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.85.2 Calling Interface

The calling interface of the **xp_target_tangent_sun** CFI function is the following (input parameters are underlined):

```
#include <explorer pointing.h>
{
                    sat id;
    long
    xp attitude id attitude id = {NULL};
    xp atmos id
                    atmos id = {NULL};
                    dem id = {NULL};
    xp dem id
    xp target id
                    target id = {NULL};
    long deriv,
                      iray;
    double freq;
    long ierr[XP NUM ERR TARGET TANGENT SUN], status,
         num user target, num los target;
    status = xp target tangent sun(&sat id,
              &attitude id, &atmos id, &dem id,
              &deriv, &iray, &freq,
              &num user target, &num los target,
              &target id, ierr);
    /* Or, using the run id */
    long run id;
    status = xp target tangent sun run(&run id,
```

}

Code: EO-MA-DMS-GS-0005

7.86.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_tangent_moon** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_tangent_moon** function by calling the function of the EO POINTING software library **xp_get_code** (see [GEN SUM]).

Table 227: Error messages of xp_target_tangent_moon function

Error type	Error message	Cause and impact	Error code	Error No

7.87 xp_target_sc

7.87.1 Overview

The xp_target_sc CFI function computes the pointing from one satellite to another satellite.

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.87.2 Calling Interface

The calling interface of the xp target sc CFI function is the following (input parameters are <u>underlined</u>):

The XP NUM ERR TARGET SC constant is defined in the file explorer pointing.h.

7.87.3 Input Parameters

The **xp_target_sc** CFI function has the following input parameters:

Table 228: Input parameters of xp_target_sc function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_id1	long *	-	Satellite ID of source satellite	-	Complete
attitude_id1	xp_attitude _id*	-	Structure that contains the Attitude (input/output) of source satellite	-	-

Date:

Issue: 10/05/2019

Page: 345

sat_id2	long *	-	Satellite ID of target satellite	-	Complete
attitude_id2	xp_attitude _id*	-	Structure that contains the Attitude (input/output) of target satellite	-	-
deriv	long *	-	Derivative ID	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Derivative switch: deriv. See current document, Table 3.

7.87.4 Output Parameters

The output parameters of the **xp_target_sc** CFI function are:

Table 229: Output parameters of xp_target_sc

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
num_user_t arget	long*	-	Number of user defined targets calculated	-	>= 0 (Set to 1 for non multi-target routines)

7.88 xp_multi_target_inter

7.88.1 Overview

The **xp_multi_target_inter** CFI function computes the first or the second intersection points of the line of sight from the satellite (defined by an elevation and an azimuth angle expressed in the selected Attitude Frame) with surfaces located at certain geodetic altitudes over the Earth.

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.88.2 Calling Interface

The calling interface of the **xp_multi_target_inter** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>
{
                    sat id;
    long
    xp attitude id attitude id = {NULL};
    xp atmos id
                    atmos id = {NULL};
    xp dem id
                    dem id = {NULL};
                   target id = {NULL};
    xp target id
    long deriv, inter flag, iray;
    double los az, los el, geod alt[XP MAX NUM MULTI TARGET],
             los az rate, los el rate, freq;
    long ierr[XP NUM ERR MULTI TARGET INTER], num target, status
             num user target, num los target;
    status = xp multi target inter(&sat id,
              &attitude id,
              &atmos id,
              &dem id,
              &deriv, &inter flag, &los az,
              &los el, &num target, geod alt, &los az rate,
              &los el rate, &iray, &freq,
              &num user target, &num los target,
              &target id, ierr);
    /* Or, using the run_id */
    long run id;
```

7.89 xp_multi_target_travel_time

7.89.1 Overview

The **xp_multi_target_travel_time** CFI function computes the points of the line or sight from the satellite (defined by an elevation and an azimuth angle expressed in the selected Attitude Frame) at given travel times along the (curved) line of sight.

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.89.2 Calling Interface

The calling interface of the **xp_multi_target_travel_time** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>
{
                    sat id;
    long
    xp attitude id attitude id = {NULL};
    xp atmos id
                    atmos id = {NULL};
    xp dem id
                    dem id = {NULL};
                    target id = {NULL};
    xp target id
    long deriv, iray;
    double los az, los el, travel time[XP_MAX_NUM_MULTI_TARGET];
    double los az rate, los el rate, travel time rate, freq;
    long num target, num user target, num los target;
    long ierr[XP NUM ERR MULTI TARGET TRAVEL TIME], status;
    status = xp multi target travel time(&sat id,
              &attitude id,
              &atmos id,
              &dem id,
              &deriv, &los az, &los el,
              &num target, travel time, &los az rate,
              &los el rate,
                               &travel time rate, &iray, &freq,
              &num user target, &num los target,
              &target id, ierr);
    /* Or, using the run_id */
    long run id;
```

7.90 xp_target_list_inter

7.90.1 Overview

The **xp_target_list_inter** CFI function computes the first or the second intersection point of the line of sight from the satellite (expressed as pairs of azimuth and elevation angles in the selected Attitude Frame) with a surface located at a certain geodetic altitude over the Earth.

The sets of azimuth and elevation points can be defined in 3 different ways:

- A list of azimuth and elevation pairs.
- A strip of lines of sight, with a fixed azimuth and elevation angles changing with a given step.
- A grid of lines of sight, with both azimuth and elevation angles changing with a given step.

For each pair a user target is computed. To obtain the extra values for all the targets, the functions xp_target_list_extra_xxx can be used. The position of the target in the output array of these extra functions has the following criterion (note also that xp_target_extra_xxx functions can also be used to obtain the results of only one target with the same index criterion, but xp_target_list_extra_xxx are optimized to obtain the results for all the targets):

- 1) In case of a list, the index of the list.
- 2) In case of a strip: being n_el the number of elevation values (note that minimum and maximum elevation values are always included in the list):

```
n el=TRUNC((max elevation-min elevation)/step elevation+1)
```

The target number is computed in increasing elevation order, from lower to upper elevation:

- For $0 \le i < n_el-1$: target number i corresponds to pair (azimuth, min_elevation + $i*step_elevation$).
- For i = n el-1: target number n el-1 corresponds to pair (azimuth, max elevation).
- 3) In case of a grid: being n_el the number of elevation values (note that minimum and maximum elevation values are always included in the list):

```
n el=TRUNC((max elevation-min elevation)/step elevation+1)
```

being n_az the number of azimuth values (note that minimum and maximum azimuth values are always included in the list):

```
n_az=TRUNC((max_azimuth-min_azimuth)/step_azimuth+1)
```

The target number is computed by increasing azimuth and elevation order: from minimum azimuth to maximum azimuth and, for every azimuth value, from minimum elevation to maximum elevation. That is:

- For $0 \le i < n_el-1$: target number i corresponds to pair (min_azimuth, min_elevation + i*step elevation).
- For i = n el-1: target number n el-1 corresponds to pair (min azimuth, max elevation).
- For $n_el \le i < 2*n_el-1$ target number i corresponds to pair (min_azimuth + step_azimuth, min elevation + i*step_elevation).

Date:

Issue: 10/05/2019

Page: 360

```
... (for 0 \le j \le n_az-1 and defining k = i-j*n_el)
```

- For $j*n_el \le i < (j+1)*n_el-1$ target number i corresponds to pair (min_azimuth + $j*step_azimuth$, min_elevation + $k*step_elevation$).
- For $i = (j+1)*n_el-1$ target number i corresponds to pair $(min_azimuth + j*step_azimuth, max elevation).$

```
(for j = n az-1 and defining k=i-(n \text{ az-1})*n \text{ el})
```

- For $(n_az-1)*n_el \le i < n_az*n_el-1$: target number i corresponds to pair $(max_azimuth , min_elevation + k*step_elevation)$.
- For i = n az*n el-1 target number i corresponds to pair (max azimuth, max elevation)

The light travel time (from the satellite to the target or vice versa) can be taken into account by the computations. For details about light propagation mode see the section 4.1.2.3.

7.90.2 Calling Interface

The calling interface of the **xp_target_list_inter** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>
                    sat id;
    long
    xp attitude id attitude id = {NULL};
                    atmos id = {NULL};
    xp atmos id
    xp dem id
                    dem id = {NULL};
                    target id = {NULL};
    xp target id
    long deriv, inter flag;

```
&instrument_data, &geod_alt,
&target_out,
&target_id, ierr);
}
```

The XP_NUM_ERR_TARGET_INTER constant is defined in the file explorer_pointing.h.

7.90.3 Input Parameters

The **xp_target_list_inter** CFI function has the following input parameters:

Table 237: Input parameters of xp_target_lists_inter function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
sat_id	long *	-	Satellite ID	-	Complete
attitude_id	xp_attitude_id*	-	Structure that contains the Attitude. (input/output)	-	-
atmos_id	xp_atmos_id*	-	Structure that contains the atmosphere initialization.	-	The atmos_id has to be initialized with any of these modes: - XP_NO_REF_INIT - XP_STD_INIT - XP_USER_INIT
dem_id	xp_dem_id*	-	Structure that contains the DEM initialization.	-	-
deriv	long *	-	Derivative ID	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
inter_flag	long *	-	Flag for first or second inter section point selection	-	Allowed values: (1) XP_INTER_1ST (2) XP_INTER_2ND
instrument_dat a	xp_instrument_ data	-	Azimuth/elevation input data and frequency	deg	0 ≤ azimuth < 360 -90 ≤ elevation <= 90
geod_alt	double *	-	Geodetic altitude over the Earth	m	>= -bWGS

It is possible to use enumeration values rather than integer values for some of the input arguments:

- Derivative switch: deriv. See current document, Table 3.
- Intersection flag: inter flag. See current document, Table 3.
- Azimuth elevation input type. See current document, Table 3.

Date:

Issue: 10/05/2019

Page: 362

7.90.4 Output Parameters

The output parameters of the **xp_target_list_inter** CFI function are:

Table 238: Output parameters of xp_target_list_inter

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_out	xp_target_ou tput*	-	Number of user and LOS defined targets calculated. Note: the memory allocated in this struct must be freed by the user	-	≥ 0
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
ierr	long	-	Error vector	-	-

7.90.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_list_inter** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_list_inter** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 239: Error messages of xp_target_list_inter function

Error type	Error message	Cause and impact	Error code	Error No
ERR	Attitude Id. is not initialized	No calculation performed	XP_CFI_TARGET_LIST_INTE R_ATTITUDE_STATUS_ERR	0

7.91 xp_target_extra_vector

7.91.1 Overview

The **xp_target_extra_vector** CFI function provides the following output parameters for the target(s) in input data structure: target position, velocity and acceleration vectors, line of sight direction, range, travel time and their corresponding derivatives.

Note on target number with targets computed with xp target list inter or xp target range:

the target_number to be used to get a specific LOS target is an incremental number. That is, if there are N user targets US1, US2, ... USN and a number of LOS targets for every user target NLOS1, NLOS2, ..., NLOSN, if we want to get LOS target with index 1 corresponding to user target US3, the target_number to be used is NLOS1+NLOS2+1.

The target number can also be got with the array returned by xp target get id data.

7.91.2 Calling Interface

The calling interface of the **xp_target_extra_vector** CFI function is the following (input parameters are underlined):

The XP_SIZE_TARGET_RESULT_VECTOR and XP_NUM_ERR_TARGET_EXTRA_VECTOR constants are defined in the file *explorer pointing.h.*

Date:

Issue: 10/05/2019

Page: 365

7.91.3 Input Parameters

The **xp_target_extra_vector** CFI function has the following input parameters:

Table 240: Input parameters of xp_target_extra_vector function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
choice	long *	-	Flag to select the extra results to be computed. Even though derivatives could be requested by user, they will not be calculated if the target was computed without derivatives (a warning is raised in this case).	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
target_type	long *		Flag to select the type of target		XP_USER_TARGET_T YPE XP_LOS_TARGET_TY PE XP_DEM_TARGET_T YPE
target_number	long *	-	Target number		>= 0

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/2<u>0</u>19

Page: 366

7.91.4 Output Parameters

The output parameters of the **xp_target_extra_vector** CFI function are:

Table 241: Output parameters of xp_target_extra_vector

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
vector_results		[0]	Target Position X (Earth-Fixed)	m

Page: 367

			Fixed)		
		[4]	Direction Rate Rate LOS Y (Earth-Fixed)	1/s2	
		[5]	Direction Rate Rate LOS Z (Earth-Fixed)	1/s2	
		[6]	Range Rate Rate to Attitude Frame Origin	m/s2	
		[7]	Travel Time Rate Rate to Attitude Frame Origin	s/s2	
		[8]	Dummy		
		[9:XP_SIZ E_TARGE T_RESUL T_VECTO R]		-	-
ierr	long	-	Error vector	-	-

Note that:

- first derivative parameters (vector_results_rate) are returned as zeros if derivative flag (deriv) was set to NO_DER when the target was computed and that second derivative parameters (vector_results_rate_rate) are returned as zeros if derivative flag (deriv) was set to NO_DER or 1ST_DER.
- when a refraction mode is selected, the second derivative parameters (vector_results_rate_rate) are returned as zeros.
- when light propagation mode is used the target position is at **target time** (see section Error: Reference source not found).

7.91.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_extra_vector** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_extra_vector** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 242: Error messages of xp_target_extra_vector function

7.92 xp_target_list_extra_vector

7.92.1 Overview

The **xp_target_list_extra_vector** CFI function provides the same results as **xp_target_extra_vector** function but for all the targets computed with **xp_target_list_inter** function.

This function has been optimized to improve the run-time performance of the target computation of all the targets and runs in multithreading (Remark: multithreading is not enabled on MacOS platforms, see section 6).

7.92.1.1 Note on multithreading:

Improvement in performance due to mutithread parallelization depends on many factors, including hardware set-up (i.e. multicore processor) and number of targets computed. In some cases (e.g. low number of targets), due to the high overhead of starting threads, parallelization may even degrade performances. In this case, it is recommended to disable multithreading or reduce the number of threads by using omp_set_num_threads openmp function.

NOTE for MACIN64 platform, Xcode 5 users:

As of version 5, llvm-gcc has been removed from Xcode and the default compiler is clang.

clang can build an application linking against the EOCFI C / C++ libraries.

However openmp is not supported by clang. Therefore, the -fopenmp shall not be used.

Functions using parallelized computations, e.g. xp target list... functions will work in single-thread mode.

7.92.2 Calling Interface

The calling interface of the **xp_target_list_extra_vector** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    long choice, target_type, target_number;
    xp_target_id target_id = {NULL};
    xp_target_extra_vector_results_list list;
    long ierr[XP_NUM_ERR_TARGET_LIST_EXTRA_VECTOR], status;

    status = xp_target_list_extra_vector (&target_id, &choice, &target_type, &list, ierr);
}
```

The XP_NUM_ERR_TARGET_LIST_EXTRA_VECTOR constant is defined in the file explorer pointing.h.

7.92.3 Input Parameters

The xp_target_list_extra_vector CFI function has the following input parameters:

Table 243: Input parameters of xp_target_list_extra_vector function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
choice	long *	-	Flag to select the extra results to be computed. Even though derivatives could be requested by user, they will not be calculated if the target was computed without derivatives (a warning is raised in this case).	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
target_type	long *		Flag to select the type of target		XP_USER_TARGET_T YPE XP_LOS_TARGET_TY PE XP_DEM_TARGET_T YPE

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/20 197

Page: 372

7.92.4 Output Parameters

The output parameters of the xp_target_list_extra_vector CFI function are:

Table 244: Output parameters of xp_target_list_extra_vector

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
list	xp_target_extra_vec tor_results_list	-	List of extra results	-	-
ierr	long	-	Error vector	-	-

The values corresponding to returned arrays are the same as in the case of xp_target_extra_vector (see 7.91.4).

7.92.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_list_extra_vector** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_list_extra_vector** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

7.93 xp_target_extra_main

7.93.1 Overview

The **xp_target_extra_main** CFI function computes the extra parameter for the target(s) in input data structure.

Note on target number with targets computed with xp target list inter or xp target range:

the target_number to be used to get a specific LOS target is an incremental number. That is, if there are N user targets US1, US2, ... USN and a number of LOS targets for every user target NLOS1, NLOS2, ..., NLOSN, if we want to get LOS target with index 1 corresponding to user target US3, the target_number to be used is NLOS1+NLOS2+1.

The target_number can also be got with the array returned by xp_target_get_id_data.

7.93.2 Calling Interface

The calling interface of the **xp_target_extra_main** CFI function is the following (input parameters are underlined):

The XP_SIZE_TARGET_EXTRA_MAIN and XP_NUM_ERR_TARGET_RESULT_MAIN constants are defined in the file *explorer_pointing.h*.

Date:

Issue: 10/05/2019

Page: 375

7.93.3 Input Parameters

The **xp_target_extra_main** CFI function has the following input parameters:

Table 246: Input parameters of xp_target_extra_main function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_i d*	-	Structure that contains the Target results	-	-
choice	long *	-	Flag to select the extra results to be computed.	-	Complete
			Even though derivatives could be requested by user, they will not be calculated if the target was computed without derivatives (a warning is raised in this case).		
target_type	long *		Flag to select the type of target		XP_USER_TARGET_T YPE
					XP_LOS_TARGET_TY PE
					XP_DEM_TARGET_T YPE
target_number	long *	-	Target number		>= 0

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/2<u>0</u>19

Page: 376

7.93.4 Output Parameters

The output parameters of the xp_target_extra_main CFI function are:

Table 247: Output parameters of xp_target_extra_main

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range

		Note: this value is only meaningful when target has been computed with xp_target_sc		
	[12:XP_SI ZE_TARG ET_RESU LT_MAIN]		-	-
ierr long	-	Error vector	-	-

Note that first derivative parameters (vector_results_rate) are returned as zeros if derivative flag (deriv) was set to NO_DER when the target was computed and that second derivative parameters (vector results rate rate) are returned as zeros if derivative flag (deriv) was set to NO_DER or 1ST_DER.

Note also that when a refraction mode is selected, the second derivative parameters (vector_results_rate_rate) are returned as zeros.

7.93.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_extra_main** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

7.94 xp_target_list_extra_main

7.94.1 Overview

The **xp_target_list_extra_main** CFI function provides the same results as **xp_target_extra_main** function but for all the targets computed with **xp** target list inter function.

This function has been optimized to improve the run-time performance of the target computation of all the targets and runs in multithreading (Remark: multithreading is not enabled on MacOS platforms, see section 6).

See note on mutithreading in section 7.92.1.1.

7.94.2 Calling Interface

The calling interface of the **xp_target_list_extra_main** CFI function is the following (input parameters are <u>underlined</u>):

The XP NUM ERR TARGET LIST EXTRA MAIN constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 382

7.94.3 Input Parameters

The **xp_target_list_extra_main** CFI function has the following input parameters:

Table 249: Input parameters of xp_target_list_extra_main function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
choice	long *	-	Flag to select the extra results to be computed.	-	Complete
			Even though derivatives could be requested by user, they will not be calculated if the target was computed without derivatives (a warning is raised in this case).		
target_type	long *		Flag to select the type of target		XP_USER_TARGET_T YPE
					XP_LOS_TARGET_TY PE
					XP_DEM_TARGET_T YPE

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/20 197

Page: 383

7.94.4 Output Parameters

The output parameters of the xp_target_list_extra_main CFI function are:

Table 250: Output parameters of xp_target_list_extra_main

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
list	xp_target_extra_mai n_results_list	-	List of extra results	-	-
ierr	long	-	Error vector	-	-

The values corresponding to returned arrays are the same as in the case of xp_target_extra_main (see section 7.93.4).

7.94.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_list_extra_main** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_list_extra_main** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 251: Error messages of xp_target_list_extra_main function

Error type	Error message	Cause and impact	Error code	Error No

7.95 xp_target_extra_aux

7.95.1 Overview

The xp_target_extra_aux CFI function computes auxiliary parameters for the target in input data structure.

Note on target number with targets computed with xp target list inter or xp target range:

the target_number to be used to get a specific LOS target is an incremental number. That is, if there are N user targets US1, US2, ... USN and a number of LOS targets for every user target NLOS1, NLOS2, ..., NLOSN, if we want to get LOS target with index 1 corresponding to user target US3, the target_number to be used is NLOS1+NLOS2+1.

The target number can also be got with the array returned by xp target get id data.

7.95.2 Calling Interface

The calling interface of the **xp_target_extra_aux** CFI function is the following (input parameters are <u>underlined</u>):

The XP_SIZE_TARGET_RESULT_AUX and XP_NUM_ERR_TARGET_EXTRA_AUX constants are defined in the file *explorer_pointing.h*.

Date:

Issue: 10/05/2019

Page: 386

7.95.3 Input Parameters

The xp_target_extra_aux CFI function has the following input parameters:

Table 252: Input parameters of xp_target_extra_aux

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
choice	long *	-	Flag to select the extra results to be computed. Even though derivatives could be requested by user, they will not be calculated if the target was computed without derivatives (a warning is raised in this case).	-	Complete
target_type	long *		Flag to select the type of target		XP_USER_TARG ET_TYPE XP_LOS_TARGE T_TYPE XP_DEM_TARG ET_TYPE
target_number	long *	-	Target number		>= 0

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/2<u>0</u>19

Page: 387

7.95.4 Output Parameters

The output parameters of the **xp_target_extra_aux** CFI function are:

Table 253: Output parameters of xp_target_extra_aux

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
aux_results double[XP_SI		[0]	Radius of curvature in the look direction at the nadir of the target (Earth fixed CS)	m	>= 0

7.96 xp_target_list_extra_aux

7.96.1 Overview

The **xp_target_list_extra_aux** CFI function provides the same results as xp_target_extra_aux function but for all the targets computed with xp_target_list_inter function.

This function has been optimized to improve the run-time performance of the target computation of all the targets and runs in multithreading (Remark: multithreading is not enabled on MacOS platforms, see section 6).

See note on mutithreading in section 7.92.1.1.

7.96.2 Calling Interface

The calling interface of the **xp_target_list_extra_aux** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    long choice, target_type, target_number;
    xp_target_id target_id = {NULL};
    xp_target_extra_aux_results_list list;
    long ierr[XP_NUM_ERR_TARGET_LIST_EXTRA_AUX], status;

    status = xp_target_list_extra_aux (&target_id, &choice, &target_type, &list, ierr);
}
```

The XP NUM ERR TARGET LIST EXTRA AUX constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 392

7.96.3 Input Parameters

The xp_target_list_extra_aux CFI function has the following input parameters:

Table 255: Input parameters of xp_target_list_extra_aux function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
choice	long *	-	Flag to select the extra results to be computed.	-	Complete
			Even though derivatives could be requested by user, they will not be calculated if the target was computed without derivatives (a warning is raised in this case).		
target_type	long *		Flag to select the type of target		XP_USER_TARGET_T YPE
					XP_LOS_TARGET_TY PE
					XP_DEM_TARGET_T YPE

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/20 197

Page: 393

7.96.4 Output Parameters

The output parameters of the xp_target_list_extra_aux CFI function are:

Table 256: Output parameters of xp_target_list_extra_aux

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
list	xp_target_extra_aux _results_list	-	List of extra results	-	-
ierr	long	-	Error vector	-	-

The values corresponding to returned arrays are the same as in the case of xp_target_extra_aux (see section 7.95.4).

7.96.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_list_extra_aux** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_list_extra_aux** function by calling the function of the EO POINTING software library **xp_get_code** (see [GEN SUM]).

7.97 xp_target_extra_ef_target

7.97.1 Overview

The **xp_target_extra_ef_target** CFI function computes the parameter for an Earth fixed target related to the target in input data structure.

Note on target_number with targets computed with xp_target_list_inter or xp_target_range:

the target_number to be used to get a specific LOS target is an incremental number. That is, if there are N user targets US1, US2, ... USN and a number of LOS targets for every user target NLOS1, NLOS2, ..., NLOSN, if we want to get LOS target with index 1 corresponding to user target US3, the target_number to be used is NLOS1+NLOS2+1.

The target number can also be got with the array returned by xp target get id data.

7.97.2 Calling Interface

The calling interface of the **xp_target_extra_ef_target** CFI function is the following (input parameters are underlined):

The XP_SIZE_TARGET_RESULT_EF_TARGET and XP_NUM_ERR_TARGET_EXTRA_EF_TARGET constants are defined in the file *explorer_pointing.h*.

Date:

Issue: 10/05/2019

Page: 396

7.97.3 Input Parameters

The xp_target_extra_ef_target CFI function has the following input parameters:

Table 258: Input parameters of xp_target_extra_ef_target function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
choice	long *	-	Flag to select the extra results to be computed. Even though derivatives could be requested by user, they will not be calculated if the target was computed without derivatives (a warning is raised in this case).	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND

7.97.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_extra_ef_target** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_extra_ef_target** function by calling the function of the EO POINTING software library **xp_get_code** (see [GEN SUM])

Table 260: Error messages of xp_target_extra_ef_target function

7.98 xp_target_list_extra_ef_target

7.98.1 Overview

The **xp_target_list_extra_ef_target** CFI function provides the same results as **xp_target_extra_ef_target** function but for all the targets computed with **xp_target_list_inter_function**.

This function has been optimized to improve the run-time performance of the target computation of all the targets and runs in multithreading (Remark: multithreading is not enabled on MacOS platforms, see section 6).

See note on mutithreading in section 7.92.1.1.

7.98.2 Calling Interface

The calling interface of the **xp_target_list_extra_ef_target** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    long choice, target_type, target_number;
    double freq;
    xp_target_id target_id = {NULL};
    xp_target_extra_ef_target_results_list list;
    long ierr[XP_NUM_ERR_TARGET_LIST_EXTRA_EF_TARGET], status;

    status = xp_target_list_extra_ef_target (&target_id, &choice, &target_type, &freq &list, ierr);
}
```

The XP_NUM_ERR_TARGET_LIST_EXTRA_EF_TARGET constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 401

7.98.3 Input Parameters

The xp_target_list_extra_ef_target CFI function has the following input parameters:

Table 261: Input parameters of xp_target_list_extra_ef_target function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
choice	long *	-	Flag to select the extra results to be computed. Even though derivatives could be requested by user, they will not be calculated if the target was computed without derivatives (a warning is raised in this case).	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
target_type	long *	-	Flag to select the type of target		XP_USER_TARGET_T YPE XP_LOS_TARGET_TY PE XP_DEM_TARGET_T YPE
freq	double *	-	Frequency of the signal	Hz	>=0

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/20 197

Page: 402

7.98.4 Output Parameters

The output parameters of the xp_target_list_extra_ef_target CFI function are:

Table 262: Output parameters of xp_target_list_extra_ef_target

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
list	xp_target_extra_ef_t arget_results_list	-	List of extra results	-	-
ierr	long	-	Error vector	-	-

The values corresponding to returned arrays are the same as in the case of xp_target_extra_ef_target (see section 7.97.4).

7.98.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_list_extra_ef_target** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_list_extra_ef_target** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 263: Error messages of xp_target_list_extra_ef_target function

7.99 xp_target_extra_target_to_sun

7.99.1 Overview

The **xp_target_extra_target_to_sun** CFI function computes extra parameters related to the pointing from the target in input data structure to the sun.

Notes:

1) On target number with targets computed with xp target list inter or xp target range:

the target_number to be used to get a specific LOS target is an incremental number. That is, if there are N user targets US1, US2, ... USN and a number of LOS targets for every user target NLOS1, NLOS2, ..., NLOSN, if we want to get LOS target with index 1 corresponding to user target US3, the target_number to be used is NLOS1+NLOS2+1.

The target_number can also be got with the array returned by xp_target_get_id_data.

2) A correction can be applied in order to compensate the travel time of light. This correction is not applied with default model. To activate this correction, the Sun model in xl_model_id must be initialized with the enum XL_MODEL_SUN_TRAVEL_TIME using the function xl_model_init (see [LIB_SUM]).

7.99.2 Calling Interface

The calling interface of the **xp_target_extra_target_to_sun** CFI function is the following (input parameters are <u>underlined</u>):

Date:

Issue: 10/05/2019

Page: 405

The XP_SIZE_TARGET_RESULT_TARGET_TO_SUN and XP_NUM_ERR_TARGET_EXTRA_TARGET_TO_SUN constants are defined in the file *explorer_pointing.h.*

Date:

Issue: 10/05/2019

Page: 406

7.99.3 Input Parameters

The xp_target_extra_target_to_sun CFI function has the following input parameters:

Table 264: Input parameters of xp_target_extra_target_to_sun function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
choice	long *	-	Flag to select the extra results to be computed. Even though derivatives could be requested by user, they will not be calculated if the target was computed without derivatives (a warning is raised in this case).	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
target_type	long *		Flag to select the type of target		XP_USER_TARGET_T YPE XP_LOS_TARGET_TY PE XP_DEM_TARGET_T YPE
target_number	long *	-	Target number		>= 0
iray	long *	-	Not used. The atmosphere refraction model can be defined via atmos_id initialization.	-	-
freq	double *	-	Frequency of the signal	Hz	>=0

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/2019

Page: 407

7.99.4 Output Parameters

The output parameters of the xp_target_extra_target_to_sun CFI function are:

Table 265: Output parameters of xp_target_extra_target_to_sun

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range

7.100 xp_target_list_extra_target_to_sun

7.100.1 Overview

The xp_target_list_extra_target_to_sun CFI function provides the same results as xp_target_extra_target_to_sun function but for all the targets computed with xp_target_list_inter function.

This function has been optimized to improve the run-time performance of the target computation of all the targets and runs in multithreading (Remark: multithreading is not enabled on MacOS platforms, see section 6).

See note on mutithreading in section 7.92.1.1.

Note: a correction can be applied in order to compensate the travel time of Sun light travel time. This correction is not applied with default model. To activate this correction, the Sun model in xl_model_id must be initialized with the enum XL_MODEL_SUN_TRAVEL_TIME using the function xl_model_init (see [LIB SUM]).

7.100.2 Calling Interface

The calling interface of the **xp_target_list_extra_to_sun** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    long choice, target_type, target_number;
    double freq;
    long iray;
    xp_target_id target_id = {NULL};
        xp_target_extra_sun_target_results_list list;
        long ierr[XP_NUM_ERR_TARGET_LIST_EXTRA_TARGET_TO_SUN], status;

    status = xp_target_list_extra_target_to_sun (&target_id, &choice, &target_type, &iray, &freq &list, ierr);
}
```

The XP_NUM_ERR_TARGET_LIST_EXTRA_TARGET_TO_SUN constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 411

7.100.3 Input Parameters

The xp_target_list_extra_target_to_sun CFI function has the following input parameters:

Table 267: Input parameters of xp_target_list_extra_target_to_sun function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
choice	long *	-	Flag to select the extra results to be computed. Even though derivatives could be requested by user, they will not be calculated if the target was computed without derivatives (a warning is raised in this case).	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
target_type	long *	-	Flag to select the type of target		XP_USER_TARGET_T YPE XP_LOS_TARGET_TY PE XP_DEM_TARGET_T YPE
iray	long *	-	Not used. The atmosphere refraction model can be defined via atmos_id initialization.	-	-
freq	double *	-	Frequency of the signal	Hz	>=0

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/20 197

Page: 412

7.100.4 Output Parameters

The output parameters of the xp_target_list_extra_target to sunCFI function are:

Table 268: Output parameters of xp_target_list_extra_target_to_sun

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
list	xp_target_extra_sun target_results_list	-	List of extra results	-	-
ierr	long	-	Error vector	-	-

The values corresponding to returned arrays are the same as in the case of xp_target_extra_target_to_sun (see section 7.99.4).

7.100.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_list_extra_target_to_sun** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_list_extra_target_to_sun** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 269: Error messages of xp_target_list_extra_target_to_sun function

7.101 xp_target_extra_target_to_moon

7.101.1 Overview

The **xp_target_extra_target_to_moon** CFI function computes extra parameters related to the pointing from the target in input data structure to the moon.

Note on target number with targets computed with xp target list inter or xp target range:

the target_number to be used to get a specific LOS target is an incremental number. That is, if there are N user targets US1, US2, ... USN and a number of LOS targets for every user target NLOS1, NLOS2, ..., NLOSN, if we want to get LOS target with index 1 corresponding to user target US3, the target_number to be used is NLOS1+NLOS2+1.

The target number can also be got with the array returned by xp target get id data.

7.101.2 Calling Interface

The calling interface of the **xp_target_extra_target_to_moon** CFI function is the following (input parameters are <u>underlined</u>):

The XP_SIZE_TARGET_RESULT_TARGET_TO_MOON and XP_NUM_ERR_TARGET_EXTRA_TARGET_TO_MOON constants are defined in the file explorer_pointing.h.

Date:

Issue: 10/05/2019

Page: 416

7.101.3 Input Parameters

The xp_target_extra_target_to_moon CFI function has the following input parameters:

Table 270: Input parameters of xp_target_extra_target_to_moon function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
choice	long *	-	Flag to select the extra results to be computed. Even though derivatives could be requested by user, they will not be calculated if the target was computed without derivatives (a warning is raised in this case).	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
target_type	long *		Flag to select the type of target		XP_USER_TARGET_T YPE XP_LOS_TARGET_TY PE XP_DEM_TARGET_T YPE
target_number	long *	-	Target number		>= 0
iray	long *	-	Not used. The atmosphere refraction model can be defined via atmos_id initialization.	-	-
freq	double *	-	Frequency of the signal	Hz	>=0

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/2019

Page: 417

7.101.4 Output Parameters

The output parameters of the xp_target_extra_target_to_moon CFI function are:

Table 271: Output parameters of xp_target_extra_target_to_moon

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range					
moon_resul ts	double [XP_SIZE_M OON_RESUL T]	[0]	Target to Moon (centre) azimuth. (Topocentric CS)	deg	>= 0 < 360					
		[1]	Target to Moon (centre) el. (Topocentric CS)	deg	>= -90 <= +90					
		[2]	Tangent altitude over theEarth in the target to Moon (centre) look direction. (Earth fixed CS)	m	-					
		[3]	Target to Moon visibility flag: - 1: Moon eclipsed by the Earth. +1: Moon in sight.	-	+1, -1					
		[4:XP_SIZ E_MOON _RESULT]	(dummy)	-	-					
moon_resul ts_rate	double [XP_SIZE_M	[0]	Target to Moon (centre) azimuthrate. (Topocentric CS)	deg/s	-					
	OON_RESUL T]	[1]	Target to Moon (centre) eleva tion- rate. (Topocentric CS)	deg/s	-					
							[2:XP_SIZ E_MOON _RESULT]	(dummy)	-	-
moon_resul ts_rate_rate	double [XP_SIZE_M	[0]	Target to Moon (centre) azimuth-rate. (Topocentric CS)	deg/s2	-					
	OON_RESUL T]	[1]	Target to Moon (centre) eleva tion- rate. (Topocentric CS)	deg/s2	-					
		[2:XP_SIZ E_MOON _RESULT]	(dummy)	-	-					
ierr	long	-	Error vector	-	-					

7.101.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_extra_target_to_moon** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

Date:

Issue: 10/05/2019

Page: 418

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_extra_target_to_moon** function by calling the function of the EO POINTING software library **xp_get_code** (see [GEN SUM]).

Table 272: Error messages of xp_target_extra_target_to_moon function

Error type	Error message	Cause and impact	Error code	Error No

7.102 xp_target_list_extra_target_to_moon

7.102.1 Overview

The **xp_target_list_extra_target_to_moon** CFI function provides the same results as xp_target_extra_target_to_moon function but for all the targets computed with xp_target_list_inter function.

This function has been optimized to improve the run-time performance of the target computation of all the targets and runs in multithreading (Remark: multithreading is not enabled on MacOS platforms, see section 6).

See note on mutithreading in section 7.92.1.1.

7.102.2 Calling Interface

The calling interface of the **xp_target_list_extra_to_moon** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    long choice, target_type, target_number;
    double freq;
    long iray;
    xp_target_id target_id = {NULL};
        xp_target_extra_moon_target_results_list list;
        long ierr[XP_NUM_ERR_TARGET_LIST_EXTRA_TARGET_TO_MOON], status;

    status = xp_target_list_extra_target_to_moon (&target_id, &choice, &target_type, &iray, &freq &list, ierr);
}
```

The $XP_NUM_ERR_TARGET_LIST_EXTRA_TARGET_TO_MOON$ constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 421

7.102.3 Input Parameters

The xp_target_list_extra_target_to_moon CFI function has the following input parameters:

Table 273: Input parameters of xp_target_list_extra_target_to_moon function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
choice	long *	-	Flag to select the extra results to be computed. Even though derivatives could be requested by user, they will not be calculated if the target was computed without derivatives (a warning is raised in this case).	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
target_type	long *	-	Flag to select the type of target		XP_USER_TARGET_T YPE XP_LOS_TARGET_TY PE XP_DEM_TARGET_T YPE
iray	long *	-	Not used. The atmosphere refraction model can be defined via atmos_id initialization.	-	-
freq	double *	-	Frequency of the signal	Hz	>=0

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/20 197

Page: 422

7.102.4 Output Parameters

The output parameters of the xp_target_list_extra_target_to_moon CFI function are:

Table 274: Output parameters of xp_target_list_extra_target_to_moon

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
list	xp_target_extra_mo on_target_results_lis t		List of extra results	-	-
ierr	long	-	Error vector	-	-

The values corresponding to returned arrays are the same as in the case of xp_target_extra_target_to_moon (see section 7.101.4).

7.102.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_list_extra_target_to_moon** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_list_extra_target_to_moon** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 275: Error messages of xp_target_list_extra_target_to_moon function

Error type	Error message	Cause and impact	Error code	Error No
ERR	No target data available	No calculation performed	XP_CFI_TARGET_LIST_TO_MO ON_NO_DATA_ERR	0

7.103 xp_target_extra_specular_reflection

7.103.1 Overview

The **xp_target_extra_specular_reflection** CFI function calculates the direction of the specular reflection associated to a given target.

Note on target number with targets computed with xp target list inter or xp target range:

the target_number to be used to get a specific LOS target is an incremental number. That is, if there are N user targets US1, US2, ... USN and a number of LOS targets for every user target NLOS1, NLOS2, ..., NLOSN, if we want to get LOS target with index 1 corresponding to user target US3, the target_number to be used is NLOS1+NLOS2+1.

The target number can also be got with the array returned by xp target get id data.

7.103.2 Calling Interface

The calling interface of the **xp_target_extra_specular_reflection** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer pointing.h>
    long target type, target number, choice, iray;
    double freq;
    double spec reflec results[XP SIZE TARGET RESULT SPEC REFL],
     spec reflec results rate[XP SIZE TARGET RESULT SPEC REFL],
     spec reflec results rate rate [XP SIZE TARGET RESULT SPEC REFL];
                   target id = {NULL};
    xp target id
    long ierr[XP NUM ERR TARGET EXTRA SPEC REFL], status;
    status = xp target extra specular reflection
                               (&target id, &choice, &target type,
                                &target number,
                                 &deflection north, &deflection east,
                                 spec reflec results,
                                 spec reflec results rate,
                                spec reflec results rate rate, ierr);
}
```

The XP_SIZE_TARGET_RESULT_SPEC_REFL and XP_NUM_ERR_TARGET_EXTRA_SPEC_REFL constants are defined in the file *explorer pointing.h*.

Date:

Issue: 10/05/2019

Page: 426

7.103.3 Input Parameters

The xp_target_extra_specular_reflection CFI function has the following input parameters:

Table 276: Input parameters of xp_target_extra_specular_reflection function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
choice	long *	-	Flag to select the extra results to be computed. Even though derivatives could be requested by user, they will not be calculated if the target was computed without derivatives (a warning is raised in this case).	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
target_type	long *		Flag to select the type of target		XP_USER_TARGET_T YPE XP_LOS_TARGET_TY PE XP_DEM_TARGET_T YPE
target_number	long *	-	Target number		>= 0
deflection_nort h	double *	-	North-South component of the vertical deflection	deg	>= -90 < = 90
deflection_east	double *	-	East-West component of the vertical deflection	deg	>= -90 < = 90

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/2<u>0</u>19

Page: 427

7.103.4 Output Parameters

The output parameters of the xp_target_extra_specular_reflection CFI function are:

Table 277: Output parameters of xp_target_extra_specular_reflection

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range

7.104 xp_target_list_extra_specular_reflection

7.104.1 Overview

The **xp_target_list_extra_specular_reflection** CFI function provides the same results as xp_target_extra_specular_reflection function but for all the targets computed with xp_target_list_inter function.

This function has been optimized to improve the run-time performance of the target computation of all the targets and runs in multithreading (Remark: multithreading is not enabled on MacOS platforms, see section 6).

See note on mutithreading in section 7.92.1.1.

7.104.2 Calling Interface

The calling interface of the **xp_target_list_extra_specular_reflection** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    long choice, target_type, target_number;
    double deflection_north, deflection_east;
    long iray;
    xp_target_id target_id = {NULL};
    xp_target_extra_spec_reflec_target_results_list list;
    long ierr[XP_NUM_ERR_TARGET_LIST_EXTRA_SPEC_REFL], status;

status = xp_target_list_extra_specular_reflection (&target_id, &choice, &target_type, &deflection_north, &deflection_east, &list, ierr);
}
```

The XP_NUM_ERR_TARGET_LIST_EXTRA_SPEC_REFL constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 432

7.104.3 Input Parameters

The xp_target_list_extra_specular_reflection CFI function has the following input parameters:

Table 279: Input parameters of xp_target_list_extra_specular_reflection function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id*	-	Structure that contains the Target results	-	-
choice	long *	-	Flag to select the extra results to be computed. Even though derivatives could be requested by user, they will not be calculated if the target was computed without derivatives (a warning is raised in this case).	-	Allowed values: (0) XP_NO_DER (1) XP_DER_1ST (2) XP_DER_2ND
target_type	long *	-	Flag to select the type of target		XP_USER_TARGET_T YPE XP_LOS_TARGET_TY PE XP_DEM_TARGET_T YPE
deflection_north	double *	-	North-South component of the vertical deflection	deg	>= -90 < = 90
deflection_east	double *	-	East-West component of the vertical deflection	deg	>= -90 < = 90

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/20 197

Page: 433

7.104.4 Output Parameters

The output parameters of the xp_target_list_extra_specular_reflection CFI function are:

Table 280: Output parameters of xp_target_list_extra_specular_reflection

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
list	xp_target_extra_spe c_reflec_target_resu lts_list		List of extra results	-	-
ierr	long	-	Error vector	-	-

The values corresponding to returned arrays are the same as in the case of xp target extra specular reflection (see section 7.103.4).

7.104.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_list_extra_specular_reflection** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_list_extra_specular_reflection** function by calling the function of the EO_POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 281: Error messages of xp_target_list_extra_specular_reflection function

Error type	Error message	Cause and impact	Error code	Error No
ERR	No target data available	No calculation performed	XP_CFI_TARGET_LIST_EXTRA_ S PECULAR_REFLECT_NO_D ATA_ERR	0
ERR	Input deflection angle is out of range	No calculation performed	XP_CFI_TARGET_LIST_EXTRA_ S PECULAR_REFLECT_WRON G_DEF_ANGLE_ERR	1

7.105xp_target_close

7.105.1 Overview

The xp_target_close CFI function cleans up any memory allocation performed by the Target functions.

7.105.2 Calling Interface

The calling interface of the **xp_target_close** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    xp_target_id target_id = {NULL};
    long ierr[XP_NUM_ERR_TARGET_CLOSE], status;

    status = xp_target_close(&target_id, ierr);
}
```

The XP NUM ERR TARGET CLOSE constant is defined in the file explorer_pointing.h.

Date:

Issue: 10/05/20 197

Page: 436

7.105.3 Input Parameters

The xp_target_close CFI function has the following input parameters:

Table 282: Input parameters of xp_target_close function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id*	-	Structure that contains the Target results	-	-

7.105.4 Output Parameters

The output parameters of the **xp_target_close** CFI function are:

Table 283: Output parameters of xp_target_close

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
ierr	long	-	Error vector	-	-

7.105.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_target_close** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp_get_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_target_close** function by calling the function of the EO_POINTING software library **xp get code** (see [GEN SUM]).

Table 284: Error messages of xp_target_close function

Page: 437

7.106 xp_target_get_id_data

7.106.1 Overview

The xp_target_get_id_data CFI function returns the target initialization data.

If the target_id has been computed with xp_target_list_inter or xp_target_range function, this function returns an array with as many elements as num_user_target. For every element, the list of LOS targets corresponding to user target are provided.

If the target_id has been computed with any other function, the returned array has only one position with the list of user targets and the list of LOS targets.

Note on usage: the user must reserve the input-output array to the function, no internal allocation is done.

7.106.2 Calling interface

The calling interface of the **xp_target_get_id_data** CFI function is the following (input parameters are underlined):

7.106.3 Input parameters

The xp target get id data CFI function has the following input parameters:

Table 285: Input parameters of xp_target_get_id_data function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
target_id	xp_target_id *	-	Target Id.	-	-

7.106.4 Output parameters

The output parameters of the xp target get id data CFI function are:

Table 286: Output parameters of xp_target_get_id_data function

C name	C type	Array	Description	Unit	Allowed Range
--------	--------	-------	-------------	------	---------------

Date:

Issue: 10/05/2019

Page: 438

		Element	(Reference)	(Format)	
xp_target_get_id_da ta	long	-	Status flag	-	-
data	xp_target_id_dat a*	-	Target initialization data	-	-

7.106.5 Warnings and errors

This function does not return any error/warning code. Only the status of the function indicates if the execution was correct or not.

The possible causes of error are:

• The target id was not computed.

Date:

Issue: 10/05/2019

Page: 439

7.107 xp_gen_dem_max_altitude_file

7.107.1 Overview

The **xp_gen_dem_max_altitude_file** CFI function generates a binary file with the maximum altitudes corresponding to every mini-tile, as described in input DEM configuration file. This file is needed to the maximum altitudes algo as described in section 7.65.4.

7.107.2 Calling Interface

The calling interface of the **xp_gen_dem_max_altitude_file** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    char *dem_config_file;
    long ierr[XP_NUM_ERR_DEM_MAX_ALT_FILE], status;

    status = xp_gen_dem_max_altitude_file(dem_config_file, ierr);
}
```

The XP NUM ERR DEM MAX ALT FILE constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2019

Page: 440

7.107.3 Input Parameters

The xp_gen_dem_max_altitude_file CFI function has the following input parameters:

Table 287: Input parameters of xp_gen_dem_max_altitude_file function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
dem_config_file	Char*		DEM configuration file with description of mini tiles	-	-

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/20 197

Page: 441

7.107.4 Output Parameters

The output parameters of the xp_gen_dem_max_altitude_file CFI function are:

Table 288: Output parameters of xp_gen_dem_max_altitude_file

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
ierr	long	-	Error vector	-	-

7.107.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_gen_dem_max_altitude_file** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp_get_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_gen_dem_max_altitude_file** function by calling the function of the EO POINTING software library **xp_get_code** (see [GEN SUM]).

Table 289: Error messages of xp_gen_dem_max_altitude function

Error type	Error message	Cause and impact	Error code	Error No
ERR	Error reading DEM configuration file	No computation performed	XP_GEN_DEM_MAX_ALTITUDE _READ_DEM_CFG_ERR	0
ERR	Error allocating memory	No computation performed	XP_GEN_DEM_MAX_ALTITUDE _MEMORY_ERR	1
WARN	Some DEM tiles are not present. Corresponding altitudes set to zero.	Computation performed	XP_GEN_DEM_MAX_ALTITUDE _OPEN_TILE_WARN	2

Issue: 10/05/2019

Page: 442

7.107.6 Executable Program

The **gen_dem_max_altitude_file** executable program can be called from a Unix shell as:

> [-xo_v] [-xp_v]

[-help]

[-show]

Note that:

- Order of parameters does not matter.
- Bracketed parameters are not mandatory.
- The input DEM configuration file must have the "MiniTiles_Configuration" tag in "DEM User Parameters" section.
- [-xl_v] option for EO_LIB Verbose mode.
- [-xo_v] option for EO_ORBIT Verbose mode.
- [-xp_v] option for EO_POINTING Verbose mode.
- [-v] option for Verbose mode for all libraries (default is Silent).
- [-show] displays the inputs of the function and the results.

Example:

gen_dem_max_altitude_file -dem_config_file
S1A TEST INT DEMCFG 00000000T000000 999999999999999 0003.EOF

Date:

Issue: 10/05/2019

Page: 443

7.108 xp_gen_dem_altitudes_from_ellipsoid

7.108.1 Overview

The **xp_gen_dem_altitudes_from_ellipsoid** CFI function generates, for an input DEM ACE2 or GDEM V2 dataset, whose altitudes are expressed w.r.t the geoid, an equivalent DEM but with the heights referenced to the ellipsoid, not to the geoid. This way the geoid undulation computation can be avoided at runtime and performance can be improved.

It can be computed the whole DEM or only a set of tiles, depending on the inputs to the function. The field "set_type" of xp_gen_dem_alt_from_ellipsoid_inputs struct can take the following values to select which DEM set to compute:

- XP ALL DEM: all DEM tiles will be computed.
- XP_DEM_SET: only the tiles of the DEM fully inside the interval provided by "lon_min", "lon_max", "lat_min" and "lat_max" fields of xp_gen_dem_alt_from_ellipsoid_inputs struct are computed.

7.108.2 Calling Interface

The calling interface of the **xp_gen_dem_altitudes_from_ellipsoid** CFI function is the following (input parameters are <u>underlined</u>):

The XP NUM ERR DEM ALT FROM ELLIPSOID constant is defined in the file explorer_pointing.h.

Date:

Issue: 10/05/2019

Page: 444

7.108.3 Input Parameters

The xp_gen_dem_altitudes_from_ellipsoid CFI function has the following input parameters:

Table 290: Input parameters of xp_gen_dem_altitudes_from_ellipsoid function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
dem_config_file	char*	-	DEM configuration file with description of mini tiles	-	-
num_harmonics	long*	-	Number of harmonics to be used in geoid computation.	-	>0
output_dir	char*	-	Output directory where generated DEM will be placed	-	-
inputs	xp_gen_dem _alt_from_ell ipsoid_inputs *		DEM set to be processed	For range limits: deg	Longitude: [-180., 180.] Latitude: [-90., 90.]

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Choice. (See Table 3).

Date:

Issue: 10/05/20 197

Page: 445

7.108.4 Output Parameters

The output parameters of the xp gen_dem_altitudes_from_ellipsoid CFI function are:

Table 291: Output parameters of xp_gen_dem_altitudes_from_ellipsoid

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
ierr	long	-	Error vector	-	-

7.108.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_gen_dem_altitudes_from_ellipsoid** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO_POINTING software library **xp_get_msg** (see [GEN_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_gen_dem_altitudes_from_ellipsoid** function by calling the function of the EO POINTING software library **xp_get_code** (see [GEN_SUM]).

Table 292: Error messages of xp_gen_dem_max_altitude function

7.109 xp_attitude_transform

7.109.1 Overview

The **xp_attitude_transform** CFI function allows the user to change the reference frame in which the internal data of the attitude ids are expressed.

Remark: all attitude related computations are performed in the True of Date Coordinate System. This means that, if one attitude id has been initialized with data expressed in another reference frame (e.g. attitude file with quaternions expressed in EF), at each call of a function using such attitude id (e.g. xp_attitude_compute) one or more conversions to True of Date will be performed. If the reference frame is changed to True of Date (using xp_attitude_transform), such conversions will not be executed and this will result in a run-time performance improvement.

Note: transformation of attitude ids that are initialized with Start Tracker files is not supported.

7.109.2 Calling Interface

The calling interface of the **xp_attitude_transform** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_pointing.h>
{
    xp_transform_cfg transform_cfg;
    xp_attitude_def attitude_def;
    long ierr[XP_NUM_ERR_ATTITUDE_TRANSFORM], status;

    status = xp_attitude_transform(&transform_cfg, &attitude_def ierr);
}
```

The XP NUM ERR ATTITUDE TRANSFORM constant is defined in the file explorer pointing.h.

Date:

Issue: 10/05/2<u>0</u>19

Page: 448

7.109.3 Input Parameters

The **xp_attitude_transform** CFI function has the following input parameters:

Table 293: Input parameters of xp_attitude_transform function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
transform_cfg	xp_transform _cfg*	-	Structure containing parameters used for the transformation	-	-
attitude_def	xp_attitude_ def*	-	Structure containing: satellite nominal attitude, satellite attitude target, instrument attitude target and attitude type		

Date:

Issue: 10/05/20 197

Page: 449

7.109.4 Output Parameters

The output parameters of the xp_attitude_transform CFI function are:

Table 294: Output parameters of xp_attitude_transform

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
attitude_def	xp_attitude_def*		Structure containing: satellite nominal attitude, satellite attitude target, instrument attitude target and attitude type (Input/Output parameter)	-	-
ierr	long	-	Error vector	-	-

7.109.5 Warnings and Errors

Next table lists the possible error messages that can be returned by the **xp_attitude_transform** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO POINTING software library **xp_get_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained by translating the error vector returned by the **xp_attitude_transform** function by calling the function of the EO_POINTING software library **xp get code** (see [GEN SUM]).

Table 295: Error messages of xp_attitude_transform function

Error type	Error message	Cause and impact	Error code	Error No

7.110 xp_free_target_id_data

7.110.1 Overview

The **xp_free_target_id_data** CFI function allows the user to free the memory allocated by the xp_target_id_data structure.

7.110.2 Calling interfaces

The calling interface of the **xp_free_target_id_data** CFI function is the following (input parameters are underlined):

```
#include <explorer_pointing.h>
{
    xp_target_id_data *data;
    long num_user_target;
    long status;

status = xp_free_target_id_data(data, num_user_target);
}
```

7.110.3 Input Parameters

The **xp_free_target_id_data** CFI function has the following input parameters:

Table 296: Input parameters of xp_free_target_id_data function

C name	C type	Array Element	Description (Reference)	Unit (Format)	Allowed Range
data	xp_target_id _data	-	Structure containing the target parameters	-	-
num_user_target	long	-	Number of the targets defined by user	-	-

7.110.4 Output Parameters

The **xp** free target id data CFI function has no output parameters.

7.110.5 Warnings and Errors

The xp_free_target_id_data CFI function has no warnings and errors defined.

Note that when the value "0.000000" is defined for a function in a certain platform, it means that its running time is lower than 1 nano-second and so it can be considered as "0".

9 LIBRARY PRECAUTIONS

The following precaution shall be taking into account when using EO POINTING library:

When a message like

<LIBRARY NAME> >>> ERROR in xp_function: Internal computation error # n
or

<LIBRARY NAME>>>> WARNING in xp_function: Internal computation warning # n appears, run the program in verbose mode for a complete description of warnings and errors and call for maintenance if necessary.

10 USER REFRACTION FILE

The refraction table is needed to initialize the atmosphere id with an user initialization mode.

The file must contain the co-index of refraction at different geometric altitudes, starting from 0 Km. The altitude should be strict monotonic increasing.

The format of that file must be as follows (a text file without headers):

Table 297: User refraction file format

1st column	2 nd column	
Geometric altitude [m]	Co-index of refraction N	
0.000	<u>262.049</u>	
1000.000	238.630	
2000.000	216928	
3000.000	195.392	
<u></u>	<u></u>	
90000.000	0.001	
95000.000	0.000	
100000.000	0.000	

Note in this table that:

- the relative index of refraction $m = 1 + N \times 10^{-6}$, where N is the co-index of refraction.
- The fields of each row must be separated by blanks (at least one).
