## **DOCUMENT STATUS LOG**

| DOCUMENT STATUS LOG |   |          |          |
|---------------------|---|----------|----------|
| Issue               | Change Description  | Date     | Approval |
| 3.4                 | New document. Library first version. Issue number corresponds to CFI library issue  | 18/11/05 |          |
| 3.5                 | Maintenance release.     New features:     function xd_xml_validate   | 26/05/06 |          |
| 3.6                 | Maintenance release     New features:     Validator function and executable for XML files (xd_xml_validate and xml_validator)                                 | 24/11/06 |          |
| 3.7                 | Maintenance release     New features:     Function expcfi_check_libs     Library version for MAC OS X on Intel (32 and 64-bits)                               | 13/07/07 |          |
| 3.7.2               | Maintenance release     New features:     Reading and writing functions for TLE     New format for orbit files: reference frame added to the variable header. | 31/07/08 |          |
| 4.0                 | Maintenance release     Reading function for the numerical propagator configuration file  | 16/01/09 |          |
| 4.1                 | Maintenance release     New section added: Error: Reference source not found Error: Reference source not found     New features:                              | 07/05/10 |          |
| 4.2                 | Maintenance release     New features:     New format for the OSF to support curved MLST     New DEM configuration file  | 31/01/11 |          |
| 4.3                 | Maintenance release     New features:     Support for reading new IERS bulletins A and B data: xd_orbit_file_decimate and xd_attitude_file_decimate           | 06/02/12 |          |

#### 1. SCOPE

The EO DATA HANDLING Software User Manual provides:

- a detailed description of usage of the CFI functions included within the EO\_DATA\_HANDLING CFI software library.
- The format description of the Earth Observation Missions files as well as the available versions of those files.
- The format description (or reference to it) of other file types (e.g. TLE, SP3, IERS bulletins).

## 2.2.Nomenclature

CFI A group of CFI functions, and related software and documentation. that will be

distributed by ESA to the users as an independent unit

CFI function A single function within a CFI that can be called by the user

Library A software library containing all the CFI functions included within a CFI plus the

supporting functions used by those CFI functions (transparently to the user)

## 2.3. Note on Terminology

In order to keep compatibility with legacy CFI libraries, the Earth Observation Mission CFI Software makes use of terms that are linked with missions already or soon in the operational phase like the Earth Explorers.

This may be reflected in the rest of the document when examples of Mission CFI Software usage are proposed or description of Mission Files is given.

#### 4. INTRODUCTION

#### 4.1. Functions Overview

This software library contains a set of functions for reading and writing Earth Observation Mission Files. The following CFI functions are included:

#### 4.1.1.Reading routines

- xd\_read\_att: reads a generic attitude file.
- xd read att def: reads a whole attitude definition file
- xd read bulletin: reads the time correlations from an IERS bulletin B (1980 and 2010 format).
- xd read bulletin 2: reads the time correlations from a IERS bulletins A and B (only 2010 format).
- xd read dem: provides the points of a DEM that are adjacent to a given point.
- xd read dem config file: reads a DEM configuration file.
- xd read doris: reads DORIS Navigator files for CRYOSAT and SENTINEL 3.
- xd\_read\_doris\_header: reads the MPH and SPH data from a DORIS Navigator file for CRYOSAT.
- xd\_read\_fhr: reads the fixed header for an Earth Observation XML file.
- xd\_read\_orbit\_file: reads orbit files consisting in a list of state vectors of the satellite in the orbit. The following files are supported: Predicted Orbit files, Restituted Orbit files and DORIS Preliminary files.
- xd read osf: reads Orbit Scenario files.
- xd read precise propag file: reads a data file used to configure the numerical propagator
- xd read sdf: reads swath definition files.
- xd read sp3: reads a Standard Product 3 C (SP3-C) File
- xd read star: reads the parameters of one star in a star database file.
- xd read star file: reads a star database file.
- xd read star id: reads the list of star id. from a star database file
- xd read star tracker: reads an star traker file for CRYOSAT.
- xd read star tracker conf file: reads an star tracker configuration file for CRYOSAT.
- xd read station: reads the parameters of one station in a station database file.
- xd read station file: reads a station database file.
- xd read station id: reads the list of station names from a station database file
- xd read stf: reads swath template files.
- xd\_read\_stf\_vhr: reads the variable header for swath template files

Code: EO
Date:
Issue:

EO-MA-DMS-GS-0007 10/05/2019

4.17

- **xd\_read\_tle:** reads a TLE file
- xd\_read\_zone: reads the parameters of one zone in a zone database file.
- xd read zone file: reads a zone database file.
- xd\_read\_zone\_id: reads the list of zone names from a zone database file.

#### 4.1.2. Writing routines

- xd\_write\_att: writes a generic attitude file.
- xd write att def: writes a attitude definition file
- xd write doris: writes a DORIS Navigator file.
- xd write orbit file: writes an orbit file using as input an structure with the data of the file
- xd write osf: writes an orbit scenario file using as input an structure with the data of the file
- **xd\_write\_stf**: writes a swath template file using as input the data structure containing the data for the swath.
- xd\_write\_tle: writes a TLE file using as input a data structure.

#### 4.1.3. Functions to free memory

- xd free orbit: frees the memory allocated during the reading function xd read orbit file.
- xd free doris: frees the memory allocated during the reading function xd read doris
- xd free osf: frees the memory allocated during the reading function xd read osf.
- xd free sdf: frees the memory allocated during the reading function xd read sdf.
- xd free stf: frees the memory allocated during the reading function xd read stf.
- xd free stf vhr: frees the memory allocated during the reading function xd read stf vhr.
- xd free att: frees the memory allocated during the reading function xd read att.
- xd free star tracker: frees the memory allocated during the reading function
- xd read star tracker.
- xd free dem: frees the memory allocated in the reading function xd read dem
- xd free zone: frees the memory allocated during the reading function xd read zone.
- xd free zone file: rees the memory allocated during the reading function xd read zone file.
- xd free zone id: frees the memory allocated during the reading function xd read zone id.
- xd free station file: frees the memory allocated during the reading function
- xd read station file.
- xd free station id: frees the memory allocated during the reading function xd read station id.

## 4.1.4. Validation of XML files

- xd xml validate: validates an XML file using an XML schema as reference.
- xd\_select\_schema: it returns the most recent schema name supported for a given file type and mission

Code: Date: Issue:

EO-MA-DMS-GS-0007 10/05/2019

4.17 31

## 4.2. Reading and writing files

When reading files, the user should be aware that:

- Many of the structures used for reading files contain dynamic data that is allocated within the reading function. In these cases, the memory has to be freed when it is not going to be used any more by calling the suitable function.
- The reading functions for each of the file types, does not read the fixed header. The fixed header could be read independently using the CFI function xd read fhr.
- When reading the fixed header with xd read fhr, the schema name is not read (the "schema" element in the output structure xd fhr will be set to "NOSCHEMA"). If required, the schema name and version should be read independently with the CFI functions in explorer file handling.

When writing files, the user should be aware that:

- The schema name and version can be written in the file in the following ways:
  - Setting the schema name in the "schema" element in the xd fhr structure. When calling the xd write xxx function, the schema name and version will be written in the file. Note that if the schema name is set to "NOSCHEMA\_", the schema attributes will no be written in the file.
  - After writing the file, by calling the function **xf** set schema (in explorer file handling). Note that the CFI function xd select schema allows to get the default schema name with which the file to be written is compliant.

## 4.3. Memory usage

Note: due to the implementation of the third-party library handling XML files, large amount of memory may be needed by an application handling (reading or writing) a file with many entries. Therefore the user is recommended to perform handling of large files on computers equipped with adequate memory resources. If these resources are not available, the user has to properly configure virtual memory and take into account long execution times. In extreme cases, due to platform limitation or operating system settings, the operation may fail. In order to give an indication, a restituted orbit file covering a period of 10 days and a time interval between OSVs of 30 sec contains 28800 OSVs and its size on disk is about 14MB. The memory usage peak during the writing of such file is about 215MB.

## 6. LIBRARY USAGE

The EO\_DATA\_HANDLING software library has the following dependencies:

- Other EOCFI libraries: EO FILE HANDLING (See [F H SUM]).
- Third party libraries:
  - POSIX thread library: libpthread.so (Note: this library is normally pre-installed in Linux and MacOS platforms. For Windows platforms, pthread.lib is included in the distribution package, with license LGPL);
  - GEOTIFF, TIFF, PROJ, LIBXML2 libraries (these libraries are included in the distribution package. Their usage terms and conditions are available in the file "TERMS AND CONDITIONS.TXT" which is part of the distribution package).

The following is required to compile and link a Software application that uses the EO\_DATA\_HANDLING software library functions (it is assumed that the required EOCFI and third-part libraries are located in directory *cfi\_lib\_dir* and the required header files are located in *cfi\_include*, see [GEN\_SUM] for installation procedures):

- 1) include the following header files in the source code:
  - explorer data handling.h (for a C application)
- 2) use the following compile and link options:

Linux and MacOS platforms:

- -Icfi include dir -Lcfi lib dir -lexplorer data handling
- -lexplorer file handling -lgeotiff -ltiff -lproj -lxml2 -lm -lc -lpthread

#### Windows platforms:

/I "cfi include dir" /libpath: "cfi lib dir" libexplorer data handling.lib

libexplorer file handling.lib libgeotiff.lib libtiff.lib libproj.lib libxml2.lib pthread.lib Ws2 32.lib

All functions described in this document have a name starting with the prefix xd

To avoid problems in linking a user application with the EO\_DATA\_HANDLING software library due to the existence of names multiple defined, the user application should avoid naming any global software item beginning with either the prefix  $\mathtt{XD}$  or  $\mathtt{xd}$ .

It is possible to call the following CFI functions from a user application.

Table 1: CFI functions included within EO\_DATA\_HANDLING library

| Function Name      | Enumeration value | Long |
|--------------------|-------------------|------|
| Main CFI Functions |                   |      |

| Function Name           | Enumeration value          | Long |
|-------------------------|----------------------------|------|
| xd_read_fhr             | XD_READ_FHR_ID             | 0    |
| xd_read_bulletin        | XD_READ_BULLETIN_ID        | 1    |
| xd_read_orbit_file      | XD_READ_ORBIT_FILE_ID      | 2    |
| xd_read_doris           | XD_READ_DORIS_ID           | 3    |
| xd_read_doris_header    | XD_READ_DORIS_HEADER_ID    | 4    |
| xd_read_osf             | XD_READ_OSF_ID             | 5    |
| xd_read_sdf             | XD_READ_SDF_ID             | 6    |
| xd_read_stf             | XD_READ_STF_ID             | 7    |
| xd_read_stf_vhr         | XD_READ_STF_VHR_ID         | 8    |
| xd_read_att             | XD_READ_ATT                | 9    |
| xd_read_star_tracker    | XD_READ_STAR_TRACKER_ID    | 10   |
| xd_read_str_conf_file   | XD_READ_STR_CONF_FILE_ID   | 11   |
| xd_read_dem_config_file | XD_READ_DEM_CONFIG_FILE_ID | 12   |
| xd_read_dem             | XD_READ_DEM_ID             | 13   |
| xd_read_star            | XD_READ_STAR_ID            | 14   |
| xd_read_star_file       | XD_READ_STAR_FILE_ID       | 15   |
| xd_read_star_id         | XD_READ_STAR_ID_ID         | 16   |
| xd_read_station         | XD_READ_STATION_ID         | 17   |
| xd_read_station_file    | XD_READ_STATION_FILE_ID    | 18   |
| xd_read_station_id      | XD_READ_STATION_ID_ID      | 19   |
| xd_read_zone            | XD_READ_ZONE_ID            | 20   |
| xd_read_zone_file       | XD_READ_ZONE_FILE_ID       | 21   |
| xd_read_zone_id         | XD_READ_ZONE_ID_ID         | 22   |
| xd_write_orbit_file     | XD_WRITE_ORBIT_FILE_ID     | 23   |
| xd_write_doris          | XD_WRITE_DORIS_ID          | 24   |
| xd_write_osf            | XD_WRITE_OSF_ID            | 25   |
| xd_write_stf            | XD_WRITE_STF_ID            | 26   |
| xd_write_att            | XD_WRITE_ATT_ID            | 27   |
| xd_xml_validate         | XD_XML_VALIDATE_ID         | 28   |
| xd_read_tle             | XD_READ_TLE                | 29   |
| xd_write_tle            | XD_WRITE_TLE               | 30   |

| Function Name               | Enumeration value              | Long |
|-----------------------------|--------------------------------|------|
| xd_read_precise_propag_file | XD_READ_PRECISE_PROPAG_FILE_ID | 31   |
| xd_orbit_file_decimate      | XD_ORBIT_FILE_DECIMATE_ID      | 33   |
| xd_attitude_file_decimate   | XD_ATTITUDE_FILE_DECIMATE_ID   | 34   |
| xd_read_att_def             | XD_READ_ATT_DEF_ID             | 35   |
| xd_write_att_def            | XD_WRITE_ATT_DEF_ID            | 36   |
| xd_read_sp3                 | XD_READ_SP3_ID                 | 37   |
| xd_xslt_add                 | XD_XSLT_ADD_ID                 | 38   |
| xd_read_oem                 | XD_READ_OEM_ID                 | 39   |
| xd_orbit_file_diagnostics   | XD_ORBIT_FILE_DIAGNOSTICS_ID   | 40   |
| Error Handling Functions    |                                |      |

| xd_silent                   |                                |      |
| xd_get_code                 | not applicable                 |      |
| xd_get_msg                  |                                |      |
| xd_print_msg                |                                |      |

#### Notes about the table:

- To transform the extended status flag returned by a CFI function to either a list of error codes or a list of error messages, the enumeration value (or the corresponding long value) described in the table must be used
- The error handling functions have no enumerated values

Whenever available it is strongly recommended to use enumeration values rather than integer values.

## 6.1. Usage hints

Every CFI function has a different length of the Error Vector, used in the calling I/F examples of this SUM and defined at the beginning of the library header file. In order to provide the user with a single value that could be used as Error Vector length for every function, a generic value has been defined (XD\_ERR\_VECTOR\_MAX\_LENGTH) as the maximum of all the Error Vector lengths. This value can therefore be safely used for every call of functions of this library.

Code: EO-MA-DMS-GS-0007 Date: 10/05/2019

Issue: 4.17 Page: 36

### **6.2. General Enumerations**

The aim of the current section is to present the enumeration values that can be used rather than integer parameters for some of the input parameters of the EO\_DATA\_HANDLING routines, as shown in the table below. The enumerations presented in [GEN\_SUM] are also applicable.

Table 2: Enumerations within EO\_DATA\_HANDLING library

| Input  | Description              | Enumeration value      | Long |
|--|--------------------------|------------------------|------|
| Boolean values   | False value              | XD_FALSE               | 0    |
| Doolean values   | True value               | XD_TRUE                | 1    |
| Returned status code   | Error                    | XD ERR                 | -1   |
|  | Ok status                | XD OK                  | 0    |
|  | Warning                  | XD_WARN                | 1    |
| Time initialization  | Select the whole file    | XD SEL FILE            | 0    |
|  | Select a time range      | XD SEL TIME            | 1    |
|  | Select an orbit range    | XD_SEL_ORBIT           | 2    |
|  | Select the default value | XD SEL DEFAULT         | 3    |
|  | Undefined                | XD TIME UNDEF          | -1   |
|  | TAI                      | XD TIME TAI            | 0    |
| Time reference   | UTC                      | XD TIME UTC            | 1    |
|  | UT1                      | XD_TIME_UT1            | 2    |
|  | GPS                      | XD TIME GPS            | 3    |
|  | Quaternions              | XD ATT QUATERNIONS     | 0    |
| Attitude data type   | Angles                   | XD ATT ANGLES          | 1    |
|  |                          | XD NO REF              | 0    |
|  |                          | XD STD REF             | 1    |
|  |                          | XD USER REF            | 2    |
|  |                          | XD PRED REF            | 3    |
|  |                          | XD STD REF N           | 10   |
|  |                          | XD USER REF N          | 20   |
|  |                          | XD PRED REF N          | 30   |
|  |                          | XD US76 REF            | 300  |

The use of the previous enumeration values could be restricted by the particular usage within the different CFI functions. The actual range to be used is indicated within a dedicated reference named *allowed range*. When there are not restrictions to be mentioned, the allowed range column is populated with the label *complete*.

## 6.3. Data Structures

The aim of this section is to present the data structures that are used in the EO DATA HANDLING library. These structures are used as output/inputs in the reading/writing routines. The following table show the data structures with their names and the data that contains:

Table 3: EO\_DATA\_HANDLING Structures

| Standara          | Description                             |                   | Structure            | Data   |
|-------------------|---|-------------------|----------------------|--|

#### 7. CFI FUNCTIONS DESCRIPTION

The following sections describe each CFI function. The calling interfaces are described for C.

Input and output parameters of each CFI function are described in tables, where C programming language syntax is used to specify:

- Parameter types (e.g. long, double)
- Array sizes of N elements (e.g. param[N])
- Array element M (e.g. [M])

Code: EO-MA-DMS-GS-0007 Date: 10/05/2019

Issue: 4.17 Page: 71

## 7.1.xd\_read\_fhr

#### **7.1.1.0verview**

The xd read fhr CFI function reads the fixed header for Earth ExplorerObservation XML files.

#### 7.1.2. Calling interface

The calling interface of the xd read fhr CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
  char *file_name;
  xd_fhr fhr;
  long ierr[XD_NUM_ERR_READ_FHR];
  status = xd_read_fhr(file_name, &fhr, ierr);
}
```

#### 7.1.3.Input parameters

The xd\_read\_fhr CFI function has the following input parameters:

Table 4: Input parameters of xd\_read\_fhr function

| C name    | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|----------------------------|------------------|---------------|
| file_name | char*  | -                | file name                  | -                | -             |

# 7.1.4. Output parameters

The output parameters of the **xd\_read\_orbit\_file** CFI function are:

Table 5: Output parameters of xd\_read\_fhr function

| C name            | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-------------------|--------|------------------|---|------------------|---------------|
| xd_read_fhr       | long   |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                |               |
| Fixed header data | xd_fhr |                  | Data structure containing the data read from the fixed header   | -                | -             |
| ierr              | long[] | -                | Error vector  | -                | -             |

Code: EO-MA-DMS-GS-0007 Date: 10/05/2019

Issue: 4.17 Page: 72

## 7.1.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_fhr** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EOXPLORER DATA HANDLING software library **xd\_get\_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_fhr** function by calling the function of the EOXPLORER DATA HANDLING software library **xd get code** (see [GEN SUM])

Table 6: Error messages of xd\_read\_fhr function

| Error type | Error message                  | Cause and impact         | Error code                               | Error<br>No |
|------------|--------------------------------|--------------------------|--|-------------|
| ERR        | Could not open the file        | ·                        | XD_CFI_READ_FHR_OPE<br>N_FILE_ERR        | 0           |
| ERR        | Error reading the fixed header | No calculation performed | XD_CFI_READ_FHR_GET_<br>FIXED_HEADER_ERR | 1           |
| ERR        | Error closing the file         | No calculation performed | XD_CFI_READ_FHR_CLO<br>SE_FILE_ERR       | 2           |

Code: EO-MA-DMS-GS-0007 Date: 10/05/2019

10/05/2019 4.17

Issue: 4.17 Page: 73

## 7.2.xd\_read\_bulletin

#### **7.2.1.0verview**

The **xd\_read\_bulletin** CFI function reads IERS bulletin files and returns the data relevant for time correlations. Either version 1980 as version 2010 of the IERS bulletins can be read.

This function is deprecated, it is recommended to use xd read bulletin 2.

### 7.2.2. Calling interface

The calling interface of the **xd\_read\_bulletin** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  char *bulb_file;
  xd_iers_bulletin_b iers_data
  long ierr[XD_NUM_ERR_READ_BULLETIN];
  status = xd_read_bulletin (bulb_file, &iers_data, ierr);
}
```

## 7.2.3.Input parameters

The xd read bulletin CFI function has the following input parameters:

Table 7: Input parameters of xd\_read\_bulletin function

| C name    | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|----------------------------|------------------|---------------|
| bulb_file | char*  | -                | File name                  | -                | _             |

## 7.2.4. Output parameters

The output parameters of the xd\_read\_bulletin CFI function are:

Table 8: Output parameters of xd\_read\_bulletin function

| C name C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|---------------|------------------|----------------------------|------------------|---------------|
|---------------|------------------|----------------------------|------------------|---------------|

| xd_read_bulletin | long                   |   | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | - | - |
|------------------|------------------------|---|---|---|---|
|                  | xd_iers_bull<br>etin_b |   | Data structure<br>containing the data<br>read from the file   | - |   |
| ierr             | long[]                 | = | Error vector  | - | - |

#### 7.2.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_bulletin** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_bulletin** function by calling the function of the EO DATA HANDLING software library **xd get code** (see [GEN SUM])

Table 9: Error messages of xd\_read\_bulletin function

| Error<br>type | Error message                           | Cause and impact         | Error code                              | Error<br>No |
|---------------|---|--------------------------|---|-------------|
| ERR           | File does not exist                     | No calculation performed | XD_CFI_READ_BULLETIN<br>_FILE_ERR       | 0           |
| ERR           | Time table is empty or has wrong format | No calculation performed | XD_CFI_READ_BULLETIN<br>_TABLE_ERR      | 1           |
| ERR           | File is not recognized                  | No calculation performed | XD_CFI_READ_BULLETIN_<br>FILE_RECOG_ERR | 2           |

## 7.3.xd\_read\_bulletin\_2

#### **7.3.1.0verview**

The **xd\_read\_bulletin\_2** CFI function reads IERS bulletin A and B files and returns the data relevant for time correlations and polar motion. Only version 2010 of the IERS bulletin B can be read.

### 7.3.2. Calling interface

The calling interface of the **xd\_read\_bulletin\_2** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  char *bulb_file;
  xd_iers_bulletin_file iers_data
  long ierr[XD_NUM_ERR_READ_BULLETIN];
  status = xd_read_bulletin_2 (bulb_file, &iers_data, ierr);
}
```

#### 7.3.3.Input parameters

The xd read bulletin CFI function has the following input parameters:

Table 10: Input parameters of xd\_read\_bulletin\_2 function

| C name    | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|----------------------------|------------------|---------------|
| bulb_file | char*  | -                | File name                  | -                | -             |

### 7.3.4. Output parameters

The output parameters of the xd read bulletin CFI function are:

Table 11: Output parameters of xd\_read\_bulletin\_2 function

| C name             | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|--------------------|--------|------------------|---|------------------|---------------|
| xd_read_bulletin_2 | long   |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                |               |

|      | xd_iers_bull<br>etin_file |   | Data structure<br>containing the data<br>read from the file | - | - |
|------|---------------------------|---|---|---|---|
| ierr | long[]                    | - | Error vector  | - | - |

#### 7.3.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_bulletin\_2** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_bulletin\_2** function by calling the function of the EO DATA HANDLING software library **xd get code** (see [GEN SUM])

Table 12: Error messages of xd\_read\_bulletin\_2 function

| Error type | Error message                           | Cause and impact         | Error code                              | Error<br>No |
|------------|---|--------------------------|---|-------------|
| ERR        | File does not exist                     | No calculation performed | XD_CFI_READ_BULLETIN<br>_FILE_ERR       | 0           |
|            | Time table is empty or has wrong format | No calculation performed | XD_CFI_READ_BULLETIN<br>_TABLE_ERR      | 1           |
| ERR        | File is not recognized                  |                          | XD_CFI_READ_BULLETIN_<br>FILE_RECOG_ERR | 2           |

## 7.4. xd\_free\_bulletin

#### **7.4.1.0verview**

The xd free bulletin CFI function frees the memory allocated during the reading function xd read bulletin 2.

### 7.4.2. Calling interface

The calling interface of the xd free bulletin CFI function is the following (input parameters are underlined):

```
#include <explorer data handling.h>
 xd iers bulletin file bulletin data;
 xd free bulletin (&bulletin data);
```

#### 7.4.3.Input parameters

The xd free bulletin CFI function has the following input parameters:

Table 13: Input parameters of xd\_free\_bulletin function

| C name | C type                    | Array<br>Element | Description<br>(Reference)   | Unit<br>(Format) | Allowed Range |
|--------|---------------------------|------------------|------------------------------|------------------|---------------|
| . –    | xd_iers_bulle<br>tin file | -                | Bulletin file data structure | -                | _             |

## 7.4.4.Output parameters

EO-MA-DMS-GS-0007 Code: Date: Issue:

10/05/2019 4.17 78

### 7.5.xd\_read\_orbit\_file

#### **7.5.1. Overview**

The xd read orbit file CFI function reads orbit files for Earth Observation Missions. The files have to be written in XML and consist on a list of state vectors of the satellite along the orbit.

A warning is raised if at least one of the following conditions is detected:

- OSV with time going back
- OSV with repeated time
- gap (that is, the separation between one OSV and the following one is more than 330 seconds)
- inconsistency in orbit number (that is, the orbit number should not decrease between one OSV and the following one)

### 7.5.2. Calling interface

The calling interface of the xd read orbit file CFI function is the following (input parameters are underlined):

```
#include <explorer data handling.h>
 char *file name;
 long read fro flag, time orbit flag, time ref, reading osv flag;
 double start range, stop range;
 xd orbit file orbit data
 long ierr[XD NUM ERR READ ORBIT FILE];
 status = xd read orbit file (file name, & read fro flag,
                               &time orbit flag, &time ref,
                               &start range, &stop range,
                               &reading osv flag,
                               &orbit data, ierr);
}
```

### 7.5.3.Input parameters

The **xd\_read\_orbit\_file** CFI function has the following input parameters:

Table 14: Input parameters of xd\_read\_orbit\_file function

| C name C type Array Description (Reference) | Unit<br>(Format) | Allowed Range |
|---|------------------|---------------|
|---|------------------|---------------|

| file_name            | char*   | Orbit file name   | -              | -  |
|----------------------|---------|---|----------------|--|
| read_fro_flag        | long*   | flag to indicate if the input file is: <ul><li>a predicted orbit file</li><li>a restituted orbit file or a DORIS</li><li>Preliminary file</li></ul>   |                | <ul> <li>XD_TRUE for<br/>ROF and DORIS<br/>files</li> <li>XD_FALSE for<br/>POF files</li> </ul>                              |
| time_orbit_flag      | long*   | Flag for selecting the time range of the initialisation. Select either:  • XD_SEL_FILE: for reading the whole file  • XD_SEL_ORBIT: for reading the interval given by the start_range and the stop range parameters in orbits  • XD_SEL_TIME: for reading the interval given by the start_range and the stop range parameters in days |                | All  |
| time_ref             | long*   | Time reference if time_orbit_flag is XD_SEL_TIME. Dummy otherwise.  | -              | -  |
| reading_osv_fl<br>ag | long*   | flag to indicate if the state vectors data have to be read.   | _              | <ul> <li>XD_TRUE for reading the state vector data</li> <li>XD_FALSE for reading just the times and orbit numbers</li> </ul> |
| start_range          | double* | Start orbit or day  | orbits or days | -  |
| stop_range           | double* | Stop orbit or day   | orbits or days | -  |

It is possible to use enumeration values rather than integer values for some of the input arguments:

- Time model ID: time model. See [GEN SUM].
- Time reference ID: time ref. See [GEN SUM].
- Time range initialisation flag: time\_orbit\_flag. See current document, section 6.2

## 7.5.4. Output parameters

The output parameters of the xd read orbit file CFI function are:

Table 15: Output parameters of xd\_read\_orbit\_file function

| C name C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|---------------|------------------|----------------------------|------------------|---------------|
|---------------|------------------|----------------------------|------------------|---------------|

| xd_read_orbit_file | long              |   | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | - | _ |
|--------------------|-------------------|---|---|---|---|
| orbit_data         | xd_orbit_fil<br>e |   | Data structure containing the data read from the file   | - | _ |
| ierr               | long[]            | - | Error vector  | - | _ |

<u>Memory Management</u>: The *orbit\_data* structure contains pointers to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd\_free\_orbit\_file** 

#### 7.5.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_orbit\_file** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_orbit\_file** function by calling the function of the EO\_DATA\_HANDLING software library **xd get code** (see [GEN SUM])

Table 16: Error messages of xd\_read\_orbit\_file function

| Error<br>type | Error message  | Cause and impact | Error code                                   | Error<br>No |
|---------------|--|------------------|--|-------------|
| ERR           | Error in reading file  | •                | XD_CFI_READ_ORBIT_FIL<br>E_READ_ERR          | 0           |
| ERR           | Variable header not found                                      |                  | XD_CFI_READ_ORBIT_FIL<br>E_VHR_NOT_FOUND_ERR | 1           |
| ERR           | Error in getting the first ele-<br>ment inside the input range |                  | XD_CFI_READ_ORBIT_FIL<br>E_INPUT_RANGE_ERR   | 2           |

| WARN | Going back OSVs found  | File read                | XD_CFI_READ_ORBIT_FIL<br>E_TIME_GOING_BACK_WA<br>RN     | 11 |
| WARN | Inconsistency in orbit number found                              | File read                | XD_CFI_READ_ORBIT_FIL<br>E_ORBIT_NUMBER_WARN            | 12 |

## 7.6.xd\_free\_orbit\_file

#### **7.6.1.0verview**

The xd\_free\_orbit\_file CFI function frees the memory allocated during the reading function xd read orbit file.

## 7.6.2. Calling interface

The calling interface of the **xd\_free\_orbit\_file** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
   xd_orbit_file orbit_data xd_free_orbit_file (&orbit_data);
}
```

## 7.6.3.Input parameters

The **xd\_free\_orbit\_file** CFI function has the following input parameters:

Code: EO-MA-DMS-GS-0007 Date: 10/05/2019

Issue: 4.17 Page: 82

#### Table 17: Input parameters of xd\_free\_orbit\_file function

| C name     | C type            | Array<br>Element | Description<br>(Reference) | Unit (Format) | Allowed Range |
|------------|-------------------|------------------|----------------------------|---------------|---------------|
| orbit_data | xd_orbi<br>t_file | -                | Orbit data structure       | _             | _             |

## 7.6.4. Output parameters

### 7.7.xd\_read\_doris

#### **7.7.1.0verview**

The **xd\_read\_doris** CFI function reads DORIS Navigator files for Cryosat, Sentinel 3 and Jason CS (the function detects automatically the type of file).

The description of S3 DORIS can be found in CNES doc CO-SP-D0-EA-16222-CN (note: it is an internal CNES document). Note: Jason CS DORIS follows a similar format.

The following items must be considered:

- Since the file does not contain orbit numbering information, the orbit number is set to 1 at the first OSV and increased at each ANX.
- During reading operation, the following issues are taken into account:
  - 1) A packet is discarded and a warning is raised with the packet number if at least one of the following conditions is detected:
    - CRC error (only for Sentinel 3);
    - quality field = 0xFFFFFFF (packet not valid);
    - OSV time going back or repeated.
  - 2) It is assumed that, within the file, packets with same APID are sorted by sequence counter and the sequence counter is increasing by 1. If it is not increased by one a warning is raised with the packet id where the difference was found.
  - 3) If a gap is found in the file (that is, the separation between one OSV and the following one is more than 1.5 times the nominal rate of the DORIS files, which is 10 seconds), a warning is raised with the packet id where the gap was found.
  - 4) Apart from packets discarded due to conditions listed in 1), all OSVs contained in the packets will be loaded in the output data structure, regardless of any other non-nominal condition (as the ones described in 2) and 3)).

### 7.7.2. Calling interface

The calling interface of the xd\_read\_doris CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
  long status;
  char *doris_file;
  long time_mode, interpol_flag;
  double time0, time1;
  xd_doris_file doris_data
  long ierr[XD NUM ERR READ DORIS];
```

Issue: 4.17 Page: 84

#### 7.7.3.Input parameters

The xd\_read\_doris CFI function has the following input parameters:

Table 18: Input parameters of xd\_read\_doris function

| C name        | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range                                     |
|---------------|--------|------------------|---|------------------|---|
| doris_file    | char*  | -                | DORIS Navigator file name   | -                | -   |
| time_mode     | long   | -                | Flag for reading the whole file or just the requested time window   | -                | <ul><li>XD_SEL_FILE</li><li>XD_SEL_TIME</li></ul> |
| time0         | double | -                | Start time for the requested time window (if XD_SEL_TIME selected)  | days in UTC      | -   |
| time1         | double | -                | Stop time for the requested time window (if XD_SEL_TIME selected)   | days in UTC      | -   |
| interpol_flag | long   | -                | Flag to indicate if the read data are used for interpolation purposes. In that case 4 extra state vectors are read out of the requested time window | -                | XD_TRUE for interpol data     XD_FALSE otherwise  |

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Time model ID: time mode. See [GEN SUM].

## 7.7.4. Output parameters

The output parameters of the xd read doris CFI function are:

Table 19: Output parameters of xd\_read\_doris function

| C name        | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed<br>Range |
|---------------|--------|------------------|---|------------------|------------------|
| xd_read_doris | long   |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                | -                |

| doris_data | xd_doris_file | _ | DORIS data   | - | - |
|------------|---------------|---|--------------|---|---|
| ierr       | long[]        | - | Error vector | - | - |

<u>Memory Management</u>: The *doris\_data* structure contains pointers to memory allocated dynamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd\_free\_doris**.

#### 7.7.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_doris** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_doris** function by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_code** (see [GEN\_SUM])

Table 20: Error messages of xd\_read\_doris function

| Error type | Error message                                    | Cause and impact         | Error code   | Error<br>No |
|------------|--|--------------------------|--|-------------|
| ERR        | Error in memory assignation                      | No calculation performed | XD_CFI_READ_DORIS_ER<br>ROR_IN_MEMORY_ASIG_<br>ERR | 0           |

## 7.8.xd\_free\_doris

#### **7.8.1.0verview**

The xd\_free\_doris CFI function frees the memory allocated during the reading function xd\_read\_doris.

#### 7.8.2. Calling interface

The calling interface of the **xd** free doris CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
   xd_doris_file doris_data xd_free_doris (&doris_data);
}
```

#### 7.8.3.Input parameters

The **xd\_free\_doris** CFI function has the following input parameters:

Table 21: Input parameters of xd\_free\_doris function

| C name | C type            | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|--------|-------------------|------------------|----------------------------|------------------|---------------|
| _      | xd_dori<br>s_file | -                | DORIS data structure       | _                | -             |

## 7.8.4. Output parameters

Page:

4.17 88

## 7.9.xd\_read\_doris\_header

#### **7.9.1.0verview**

The xd read doris header CFI function reads the Main Product Header (MPH) and the Specific Product Header (SPH) from DORIS Navigator files for Cryosat.

### 7.9.2. Calling interface

The calling interface of the xd read doris header CFI function is the following (input parameters are underlined):

```
#include <explorer data handling.h>
 long status;
 char *doris file;
 xd doris mph sph doris hdr;
 long ierr[XD NUM ERR READ DORIS HEADER];
 status = xd read doris header(<u>doris file</u>, &doris hdr, ierr);
```

### 7.9.3.Input parameters

The xd read doris header CFI function has the following input parameters:

Table 22: Input parameters of xd\_read\_doris\_header function

| C name     | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|------------|--------|------------------|----------------------------|------------------|---------------|
| doris_file | char*  | -                | DORIS file name            | -                | -             |

It is possible to use enumeration values rather than integer values for some of the input arguments:

Time model ID: time mode. See [GEN SUM].

### 7.9.4. Output parameters

The output parameters of the xd read doris header CFI function are:

Page: 89

Table 23: Output parameters of xd\_read\_doris\_header function

| C name                   | C type               | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|--------------------------|----------------------|------------------|---|------------------|---------------|
| xd_read_doris_hea<br>der | long                 |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                | -             |
| _                        | xd_doris_m<br>ph_sph | -                | doris header structure  | -                | -             |
| ierr                     | long []              | -                | Error vector  | -                | -             |

#### 7.9.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_doris\_header** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd\_get\_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_doris\_header** function by calling the function of the EO DATA HANDLING software library **xd get code** (see [GEN SUM])

Table 24: Error messages of xd\_read\_doris function

| Error type | Error message                            | Cause and impact         | Error code  | Error<br>No |
|------------|--|--------------------------|---|-------------|
| ERR        | DORIS level 0 filename not supplied      | No calculation performed | XD_CFI_READ_DORIS_HE<br>ADER_NO_FILENAME_ER<br>R  | 0           |
| ERR        | DORIS Level 0 file cannot be open        | No calculation performed | XD_CFI_READ_DORIS_HE<br>ADER_CANNOT_OPEN_E<br>RR  | 1           |
| ERR        | Could not find keyword: %s               | No calculation performed | XD_CFI_READ_DORIS_HE<br>ADER_FINDKW_ERROR_E<br>RR | 2           |
| ERR        | Error reading DORIS data for keyword: %s | No calculation performed | XD_CFI_READ_DORIS_HE<br>ADER_READ_ERR             | 3           |

4.17 90

## 7.10.xd\_read\_osf

#### 7.10.1.0verview

The **xd\_read\_osf** CFI function reads Orbit Scenario files for Earth Observation Missions. The files have to be written in XML and consist on a list of orbital changes of the satellite along the orbit.

This function can also be used for reading the list of orbital changes within Orbit Event files.

### 7.10.2. Calling interface

The calling interface of the **xd\_read\_osf** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  char *file_name;
  xd_osf_file osf_data;
  long ierr[XD_NUM_ERR_READ_OSF];

  status = xd_read_osf (file_name, &osf_data, ierr);
}
```

## 7.10.3.Input parameters

The **xd\_read\_osf** CFI function has the following input parameters:

Table 25: Input parameters of xd\_read\_osf function

| C name    | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|----------------------------|------------------|---------------|
| file_name | char*  | -                | Orbit Scenario file name   | -                | -             |

### 7.10.4. Output parameters

The output parameters of the xd\_read\_osf CFI function are:

Table 26: Output parameters of xd\_read\_osf function

| C name C type Array Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------------------------|----------------------------|------------------|---------------|
|-----------------------------|----------------------------|------------------|---------------|

| xd_read_osf | long        |   | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | - | - |
|-------------|-------------|---|---|---|---|
| osf_data    | xd_osf_file |   | Structure with the OSF data   | - | - |
| ierr        | long[]      | - | Error vector  | - | - |

<u>Memory Management</u>: The *osf\_data* structure contains pointers to memory allocated dynamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd\_free\_osf**.

#### 7.10.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_osf** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_osf** function by calling the function of the EO\_DATA\_HANDLING software library **xd get code** (see [GEN SUM])

Table 27: Error messages of xd\_read\_osf function

| Error type | Error message                          | Cause and impact         | Error code  | Error<br>No |
|------------|--|--------------------------|---|-------------|
| ERR        | Error initializing the file parser     | No calculation performed | XD_CFI_READ_XML_OSF_<br>INIT_PARSER_ERR             | 0           |

| ERR  | Error allocating memory   | No calculation performed | XD_CFI_READ_XML_OSF_<br>MEMORY_ERR        | 6 |
|------|---|--------------------------|---|---|
| ERR  | Variable header not found   | No calculation performed | XD_CFI_READ_XML_OSF_<br>VHR_NOT_FOUND_ERR | 7 |
| ERR  | Incorrect value of<br>Time_Reference. OSF time<br>reference must be UT1 | No calculation performed | XD_CFI_READ_XML_OSF_<br>TIME_REF_OF_ERR   | 8 |
| WARN | No time reference specified in orbit scenario file. Assuming UT1        | Calculation performed    | XD_CFI_READ_XML_OSF_<br>TIME_REF_OF_WARN  | 9 |

Page: 4.17

## **7.11.** xd\_free\_osf

#### 7.11.1.0verview

The xd\_free\_osf CFI function frees the memory allocated during the reading function xd\_read\_osf.

#### 7.11.2. Calling interface

The calling interface of the xd free osf CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
   xd_osf_file osf_data xd_free_osf (&osf_data);
}
```

#### 7.11.3.Input parameters

The **xd\_free\_osf** CFI function has the following input parameters:

Table 28: Input parameters of xd\_free\_osf function

| C name   | C type      | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|----------|-------------|------------------|----------------------------|------------------|---------------|
| osf_data | xd_osf_file | -                | DORIS data structure       | -                | -             |

## 7.11.4. Output parameters

## 7.12. xd\_read\_sdf

#### 7.12.1.0verview

The **xd\_read\_sdf** CFI function reads Swath Definition files for Earth Observation Missions. For compatibility, it is possible to read files with old format.

### 7.12.2. Calling interface

The calling interface of the **xd** read sdf CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status; xd_sdf_file sdf_data; char *file_name;
  long ierr[XD_NUM_ERR_READ_SDF];

  status = xd_read_sdf (file_name, &sdf_data, ierr);
}
```

#### 7.12.3.Input parameters

The **xd** read sdf CFI function has the following input parameters:

Table 29: Input parameters of xd\_read\_sdf function

| C name    | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|----------------------------|------------------|---------------|
| file_name | char*  | -                | Swath Definition file name | -                | -             |

### 7.12.4. Output parameters

The output parameters of the xd read sdf CFI function are:

Table 30: Output parameters of xd\_read\_sdf function

| C name      | C type      | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-------------|-------------|------------------|---|------------------|---------------|
| xd_read_sdf | long        |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                | -             |
| sdf_data    | xd_sdf_file | -                | Swath Definition data structure   | -                | -             |
| ierr        | long[]      | -                | Error vector  | -                | -             |

4.17 95

<u>Memory Management</u>: The *sdf\_data* structure contains pointers to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd\_free\_sdf**.

#### 7.12.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_sdf** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_sdf** function by calling the function of the EO\_DATA\_HANDLING software library **xd get code** (see [GEN SUM])

Table 31: Error messages of xd\_read\_sdf function

| Error type | Error message                       | Cause and impact | Error code                        | Error<br>No |
|------------|-------------------------------------|------------------|-----------------------------------|-------------|
| ERR        | Error opening Swath Definition file |                  | XD_CFI_READ_SDF_OPE<br>N_FILE_ERR | 0           |
| ERR        | Error allocating memory             |                  | XD_CFI_READ_SDF_MEM<br>ORY_ERR    | 1           |

## 7.14. xd\_read\_stf

#### 7.14.1.0verview

The **xd\_read\_stf** CFI function reads Swath Template Files for Earth Observation Missions. For compatibility, it is possible to read files with old format.

### 7.14.2. Calling interface

The calling interface of the **xd read stf** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  char *file_name;
  xd_stf_file stf_data;
  long ierr[XD_NUM_ERR_READ_STF];

  status = xd_read_stf (file_name, &stf_data, ierr);
}
```

## 7.14.3.Input parameters

The xd read stf CFI function has the following input parameters:

Table 33: Input parameters of xd\_read\_stf function

| C name    | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|----------------------------|------------------|---------------|
| file_name | char*  | -                | Swath Template file name   | -                | -             |

### 7.14.4.Output parameters

The output parameters of the xd read stf CFI function are:

Code: EO-MA-DMS-GS-0007 Date: 10/05/2019

Issue: 4.17 Page: 98

Table 34: Output parameters of xd\_read\_stf function

| C name      | C type      | Array<br>Element | Description<br>(Reference)         | Unit<br>(Format) | Allowed Range |
|-------------|-------------|------------------|------------------------------------|------------------|---------------|
| xd_read_stf | long        |                  | Function status flag:              | -                | -             |
| stf_data    | xd_stf_file | -                | Swath template file data structure | -                | -             |
| ierr        | long[]      | _                | Error vector                       | _                | -             |

<u>Memory Management</u>: The <u>stf\_data</u> structure contains pointers to memory allocated dynamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd\_free\_stf**.

#### 7.14.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_stf** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_stf** function by calling the function of the EO\_DATA\_HANDLING software library **xd get code** (see [GEN SUM])

Table 35: Error messages of xd\_read\_stf function

| Error type | Error message                              | Cause and impact         | Error code                          | Error<br>No |

## 7.15.xd\_free\_stf

#### 7.15.1.0verview

The xd free stf CFI function frees the memory allocated during the reading function xd read stf.

#### 7.15.2. Calling interface

The calling interface of the xd free stf CFI function is the following (input parameters are underlined):

```
#include <explorer data handling.h>
 xd stf file stf data xd free stf (&stf data);
```

#### 7.15.3.Input parameters

The **xd** free stf CFI function has the following input parameters:

Table 36: Input parameters of xd\_free\_stf function

| C name   | C type      | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|----------|-------------|------------------|----------------------------|------------------|---------------|
| stf_data | xd_stf_file | -                | STF data structure         | -                | -             |

## 7.15.4. Output parameters

Code: EO-MA-DMS-GS-0007 Date: Issue:

Page:

10/05/2019 4.17

101

# 7.16.xd\_read\_stf\_vhr

#### 7.16.1.0verview

The xd read stf vhr CFI function reads the variable header in Swath Template File for Earth Observation Missions.

#### 7.16.2. Calling interface

The calling interface of the xd read stf vhr CFI function is the following (input parameters are underlined):

```
#include <explorer data handling.h>
 long status;
 char *file name;
 xd stf vhr vhr data;
 long ierr[XD NUM ERR READ STF VHR];
 status = xd read stf vhr (file name, &vhr data, ierr);
}
```

## 7.16.3.Input parameters

The xd\_read\_stf\_vhr CFI function has the following input parameters:

Table 37: Input parameters of xd\_read\_stf\_vhr function

|      | C name | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|------|--------|--------|------------------|----------------------------|------------------|---------------|
| file | e_name | char*^ | -                | Swath Template file name   | -                | -             |

### 7.16.4. Output parameters

The output parameters of the xd read stf vhr CFI function are:

102

Page:

Table 38: Output parameters of xd\_read\_stf\_vhr function

| C name          | C type     | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-----------------|------------|------------------|---|------------------|---------------|
| xd_read_stf_vhr | long       |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated |                  | -             |
| vhr_data        | xd_stf_vhr |                  | Data structure for the<br>Swath template variable<br>header   | -                | -             |
| ierr            | long[]     | -                | Error vector  | -                | -             |

<u>Memory Management</u>: The *vhr\_data* structure contains pointers to memory allocated dynamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd free stf vhr**.

#### 7.16.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_stf\_vhr** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_stf\_vhr** function by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_code** (see [GEN\_SUM])

Table 39: Error messages of xd\_read\_stf\_vhr function

| Error type | Error message                              | Cause and impact         | Error code                                  | Error<br>No |
|------------|--|--------------------------|---|-------------|
| ERR        | Error initializing parser to read the file | No calculation performed | XD_CFI_READ_STF_VHR_<br>INIT_PARSER_ERR     | 0           |

Page: 104

## 7.17. xd\_free\_stf\_vhr

#### 7.17.1.0verview

The **xd\_free\_stf\_vhr** CFI function frees the memory allocated during the reading function xd read stf vhr.

### 7.17.2. Calling interface

The calling interface of the **xd\_free\_stf\_vhr** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
  xd_stf_vhr stf_vhr;
  xd_free_stf_vhr (&stf_vhr);
}
```

### 7.17.3.Input parameters

The xd free stf vhr CFI function has the following input parameters:

Table 40: Input parameters of xd\_free\_stf\_vhr function

| C name  | C type     | Array<br>Element | Description<br>(Reference)              | Unit<br>(Format) | Allowed Range |
|---------|------------|------------------|---|------------------|---------------|
| stf_vhr | xd_stf_vhr |                  | STF variable header data struc-<br>ture | -                | -             |

## 7.17.4. Output parameters

## 7.18.xd\_read\_att

#### 7.18.1.0verview

The xd\_read\_att CFI function reads attitude generic files. This files have to be written in XML and consits on a list of attitude angles or quaternions.

#### 7.18.2. Calling interface

The calling interface of the xd read att CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status; xd_att_file att_data; char *file_name;
  long ierr[XD_NUM_ERR_READ_ATT];

  status = xd_read_att (file_name, att_data, ierr);
}
```

#### 7.18.3.Input parameters

The xd read att CFI function has the following input parameters:

Table 41: Input parameters of xd\_read\_att function

| C name    | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|----------------------------|------------------|---------------|
| file_name | char*  | -                | Attitude file name         | -                | -             |

### 7.18.4. Output parameters

The output parameters of the **xd\_read\_** CFI function are:

Code: EO-MA-DMS-GS-0007 Date: 10/05/2019

Issue: 4.17 Page: 106

Table 42: Output parameters of xd\_read\_att function

| C name      | C type      | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowd Range |
|-------------|-------------|------------------|---|------------------|--------------|
| xd_read_att | long        |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated |                  | -            |
| att_data    | xd_att_file | _                | Attitude data structure   | -                | -            |
| ierr        | long[]      | _                | Error vector  | -                | -            |

<u>Memory Management</u>: The *att\_data* structure contains pointers to memory allocated dynamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd\_free\_att**.

#### 7.18.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_att** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd\_get\_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_att** function by calling the function of the EO\_DATA\_HANDLING software library **xd get code** (see [GEN SUM])

Table 43: Error messages of xd\_read\_att function

| Error type | Error message                              | Cause and impact         | Error code                              | Error<br>No |

## 7.19.xd\_free\_att

#### 7.19.1.0verview

The xd free att CFI function frees the memory allocated during the reading function xd read att.

### 7.19.2. Calling interface

The calling interface of the xd\_free\_att CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  xd_att_file att_data;
  xd_free_att (&att_data);
}
```

### 7.19.3.Input parameters

The xd\_free\_att CFI function has the following input parameters:

Table 44: Input parameters of xd\_free\_att function

| C name   | C type      | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|----------|-------------|------------------|----------------------------|------------------|---------------|
| att_data | xd_att_file | -                | Attitude data structure    | -                | -             |

## 7.19.4. Output parameters

# 7.20.xd\_read\_star\_tracker

#### 7.20.1.0verview

The xd\_read\_star\_tracker CFI function reads a list of star tracker files for Cryosat.

### 7.20.2. Calling interface

The calling interface of the **xd\_read\_star\_tracker** CFI function is the following (input parameters are <u>underlined</u>):

# 7.20.3.Input parameters

The xd read star tracker CFI function has the following input parameters:

Table 45: Input parameters of xd\_read\_star\_tracker function

| C name         | C type  | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range                        |
|----------------|---------|------------------|---|------------------|--------------------------------------|
| n_files        | long    | -                | Number of input files   | -                | > 0                                  |
| file_list      | char ** | -                | List of star tracker files  | -                | -                                    |
| time_init_mode | long    |                  | Flag for reading the whole file or just the requested time window |                  | • XD_SEL_FILE<br>or<br>• XD_SEL_TIME |
| time0          | double  |                  | Start time for the requested time window                          | -                | days (TAI)                           |

| time1     | Stop time for the requested time window                                     | _ | days (TAI) |
|-----------|---|---|------------|
| str_limit | <br>data structure containing the lim-<br>its for the quaternion validation | - | -          |

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Time range initialisation flag: time init mode. See current document, section 6.2

### 7.20.4. Output parameters

The output parameters of the xd read star tracker CFI function are:

Table 46: Output parameters of xd\_read\_star\_tracker function

| C name               | C type               | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed<br>Range |
|----------------------|----------------------|------------------|---|------------------|------------------|
| xd_read_star_tracker | long                 |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | _                | -                |
| str_data             | xd_star_tracker_file |                  | Star tracker data struc-<br>ture  | -                | -                |
| ierr                 | long[]               | -                | Error vector  | _                | -                |

<u>Memory Management</u>: The *str\_data* structure contains pointers to memory allocated dynamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd free star tracker**.

# 7.20.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_star\_tracker** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_star\_tracker** function by calling the function of the EO DATA HANDLING software library **xd\_get\_code** (see [GEN\_SUM])

# 7.21.xd\_free\_star\_tracker

#### 7.21.1.0verview

The xd\_free\_star\_tracker CFI function frees the memory allocated during the reading function xd read star tracker.

# 7.21.2. Calling interface

The calling interface of the **xd\_free\_star\_tracker** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  xd_star_tracker_file str_data;
  xd_free_star_tracker (&str_data);
}
```

### 7.21.3.Input parameters

The xd free star tracker CFI function has the following input parameters:

Table 48: Input parameters of xd\_free\_star\_tracker function

| C name   | C type               | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|----------|----------------------|------------------|-----------------------------|------------------|---------------|
| str_data | xd_star_tracker_file | -                | Star tracker data structure | -                | -             |

# 7.21.4. Output parameters

This function does not return any value nor parameters.

Page: 113

# 7.22.xd\_read\_star\_tracker\_conf\_file

#### 7.22.1.0verview

The **xd\_read\_star\_tracker\_conf\_file** CFI function reads an star tracker configuration file for Cryosat. The files have to be written in XML.

### 7.22.2. Calling interface

The calling interface of the **xd\_read\_star\_tracker\_conf\_file** CFI function is the following (input parameters are <u>underlined</u>):

# 7.22.3.Input parameters

The xd read star tracker conf file CFI function has the following input parameters:

Table 49: Input parameters of xd\_read\_star\_tracker\_conf\_file function

| C name          | C type | Array<br>Element | Description<br>(Reference)   | Unit<br>(Format) | Allowed Range |
|-----------------|--------|------------------|--|------------------|---------------|
| file_name       | char*  |                  | Star Tracker configuration file name                               | -                | -             |
| star_tracker_id | long   |                  | Star tracker number for which the configuration data is to be read | -                | 1, 2 or 3     |

# 7.22.4. Output parameters

The output parameters of the xd\_read\_star\_tracker\_conf\_file CFI function are:

Table 50: Output parameters of xd\_read\_star\_tracker\_conf\_file function

| C name                             | C type                   | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|------------------------------------|--------------------------|------------------|---|------------------|---------------|
| xd_read_star_track<br>er_conf_file | long                     |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                | -             |
| _                                  | xd_tracker_<br>conf_file |                  | Star tracker configuration data structure with  | -                | -             |
| ierr                               | long[]                   | -                | Error vector  | -                | -             |

#### 7.22.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_star\_tracker\_conf\_file** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd\_get\_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_star\_tracker\_conf\_file** function by calling the function of the EO DATA HANDLING software library **xd get code** (see [GEN SUM])

Table 51: Error messages of xd\_read\_star\_tracker\_conf\_file function

| Error type | Error message    | Cause and impact         | Error code                                  | Error<br>No |
|------------|------------------|--------------------------|---|-------------|
| ERR        | Wrong input file | No calculation performed | XD_CFI_READ_STR_CON<br>F_FILE_READ_FILE_ERR | 0           |

Page: 115

# 7.23. xd\_read\_dem

#### 7.23.1.0verview

The **xd\_read\_dem** CFI function reads a DEM file providing the table with the altitudes for each point of the grid of the DEM file.

# 7.23.2. Calling interface

The calling interface of the xd read dem CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  char *dem_name;
  xd_dem_config_file dem_conf_data;
  xd_dem_file dem_data;
  long ierr[XD_NUM_ERR_READ_DEM];

  status = xd_read_dem (dem_name, &dem_conf_data, &dem_data, ierr);
}
```

# 7.23.3.Input parameters

The xd read dem CFI function has the following input parameters:

Table 52: Input parameters of xd\_read\_dem function

| C name         | C type                 | Array<br>Element | Description<br>(Reference)   | Unit<br>(Format) | Allowed Range |
|----------------|------------------------|------------------|--|------------------|---------------|
| dem_name       | char*                  |                  | DEM file name (do not include<br>the path)   | _                | -             |
| dem_conf_dat a | xd_dem_c<br>onfig_file |                  | DEM configuration data struc-<br>ture. This data are read from a<br>configuration file with<br>xd_read_dem_config_file |                  | -             |

It is possible to use enumeration values rather than integer values for some of the input arguments:

- Time model ID: time model. See [GEN SUM].
- Time reference ID: time ref. See [GEN SUM].
- Time range initialisation flag: time init mode. See current document, section 6.2

Page: 116

#### 7.23.4. Output parameters

The output parameters of the xd read dem CFI function are:

Table 53: Output parameters of xd\_read\_dem function

| C name      | C type      | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-------------|-------------|------------------|---|------------------|---------------|
| xd_read_dem | long        |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated |                  |               |
| dem_data    | xd_dem_file | -                | DEM data structure  | -                | -             |
| ierr        | long[]      | -                | Error vector  | -                | -             |

<u>Memory Management</u>: The <u>dem\_data</u> structure contains pointers to memory allocated dynamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd free dem**.

### 7.23.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_dem** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_dem** function by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_code** (see [GEN\_SUM])

Table 54: Error messages of xd\_read\_dem function

| Error type | Error message  | Cause and impact | Error code                             | Error<br>No |
|------------|--|------------------|--|-------------|
| ERR        | Memory allocation error  | •                | XD_CFI_READ_DEM_MEM<br>ORY_ERR         | 0           |
|            | Incorrect input DEM configuration file. In case of using a Generic Raster DEM, this error message is used also to indicate problems in 'dem_raster_configuration.xml'. |                  | XD_CFI_READ_DEM_NO_<br>CONFIG_FILE_ERR | 1           |

| ERR | Wrong input file name       | No calculation performed | XD_CFI_READ_DEM_WRO<br>NG_FILENAME_ERR | 2 |
|-----|-----------------------------|--------------------------|--|---|
| ERR | Could not open the DEM file | No calculation performed | XD_CFI_READ_DEM_OPE<br>N_FILE_ERR      | 3 |
| ERR | Could not read the DEM file | No calculation performed | XD_CFI_READ_DEM_REA<br>D_FILE_ERR      | 4 |
| ERR | Unknown DEM model           | No calculation performed | XD_READ_DEM_UNKNOW<br>N_MODEL_ERR      | 5 |

# 7.24.xd\_free\_dem

#### 7.24.1.0verview

The xd\_free\_dem CFI function frees the memory allocated in the reading function xd\_read\_dem.

### 7.24.2. Calling interface

The calling interface of the **xd\_free\_dem** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  xd_dem_file dem_data;
  xd_free_dem (&dem_data);
}
```

# 7.24.3.Input parameters

The xd free dem CFI function has the following input parameters:

Table 55: Input parameters of xd\_free\_dem function

| C name   | C type      | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|----------|-------------|------------------|----------------------------|------------------|---------------|
| dem_data | xd_dem_file | _                | DEM data structure         | -                | -             |

# 7.24.4.Output parameters

This function does not return any value nor parameters.

Page:

# 7.25.xd\_read\_dem\_config\_file

#### 7.25.1.0verview

The xd read dem config file CFI function reads DEM configuration parameters. Note that the DEM version (1 or 2) is automatically detected (See [MCD] for further details about the DEM models).

# 7.25.2. Calling interface

The calling interface of the xd read dem config file CFI function is the following (input parameters are underlined):

```
#include <explorer data handling.h>
 long status;
 char *file name;
 xd dem config file dem config data;
 long ierr[XD NUM ERR READ DEM CONFIG];
 status = xd read dem config file (file name,
                                    &dem config data,
                                    ierr);
}
```

# 7.25.3.Input parameters

The xd read dem config file CFI function has the following input parameters:

Table 56: Input parameters of xd\_read\_dem\_config\_file function

| C name    | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|-----------------------------|------------------|---------------|
| file_name | char*  | -                | DEM configuration file name | _                | -             |

# 7.25.4. Output parameters

The output parameters of the xd read dem config file CFI function are:

Table 57: Output parameters of xd\_read\_dem\_config\_file function

| C name                      | C type                 | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-----------------------------|------------------------|------------------|---|------------------|---------------|
| xd_read_dem_confi<br>g_file | long                   |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                |               |
|                             | xd_dem_confi<br>g_file |                  | DEM configuration data structure  | -                | -             |
| ierr                        | long[]                 | _                | Error vector  | -                | -             |

### 7.25.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_dem\_config\_file** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd\_get\_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_dem\_config\_file** function by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_code** (see [GEN\_SUM])

Table 58: Error messages of xd\_read\_dem\_config\_file function

| Error type | Error message  | Cause and impact                                  | Error code   | Error<br>No |
|------------|--|---|--|-------------|

# 7.26. xd\_read\_zone

#### 7.26.1.0verview

The **xd\_read\_zone** CFI function reads a specific zone from a zone database file for Earth Observation Missions.

# 7.26.2. Calling interface

The calling interface of the xd\_read\_zone CFI function is the following (input parameters are underlined)

```
#include <explorer_data_handling.h>
{
  long status; char *zone_id; char *file_name;
  xd_zone_rec zone_rec;
  long ierr[XD_NUM_ERR_READ_ZONE];

  status = xd_read_zone (file_name, &zone_id, &zone_rec, ierr);
}
```

# 7.26.3.Input parameters

The xd\_read\_zone CFI function has the following input parameters:

Table 59: Input parameters of xd\_read\_zone function

| C name    | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|----------------------------|------------------|---------------|
| file_name | char*  | -                | Zone database file name    | -                | -             |
| zone_id   | char*  | -                | Zone ld to be read         | -                | -             |

Code: EO-MA-DMS-GS-0007 Date: 10/05/2019

Issue: 4.17 Page: 121

### 7.26.4. Output parameters

The output parameters of the xd read zone CFI function are:

Table 60: Output parameters of xd\_read\_zone function

| C name       | C type      | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|--------------|-------------|------------------|---|------------------|---------------|
| xd_read_zone | long        |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                | -             |
| zone_rec     | xd_zone_rec | -                | Zone Data structure   | -                | -             |
| ierr         | long[]      | -                | Error vector  | -                | -             |

<u>Memory Management</u>: The <u>zone\_rec</u> structure contains pointers to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd** free **zone**.

# 7.26.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_zone** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_zone** function by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_code** (see [GEN\_SUM])

Table 61: Error messages of xd\_read\_zone function

| Error type | Error message        | Cause and impact         | Error code                           | Error<br>No |

# 7.27.xd\_free\_zone

#### 7.27.1.0verview

The xd free zone CFI function frees the memory allocated during the reading function xd read zone.

# 7.27.2. Calling interface

The calling interface of the xd\_free\_zone CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer data handling.h>
 xd zone rec zone data;
 xd free zone (&zone data);
```

# 7.27.3.Input parameters

The **xd** free zone CFI function has the following input parameters:

Table 62: Input parameters of xd\_free\_zone function

| C name    | C type      | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|-------------|------------------|----------------------------|------------------|---------------|
| zone_data | xd_zone_rec | -                | Zone record data structure | -                | -             |

# 7.27.4. Output parameters

This function does not return any value nor parameters.

Page: 4.17

# 7.28, xd\_read\_zone\_file

#### 7.28.1.0verview

The xd\_read\_zone\_file CFI function reads a zone database file for Earth Observation Missions.

# 7.28.2. Calling interface

The calling interface of the **xd\_read\_zone\_file** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  char *file_name;
  xd_zone_file zone_data;
  long ierr[XD_NUM_ERR_READ_ZONE_FILE];

  status = xd_read_zone_file (file_name, &zone_data, ierr);
}
```

# 7.28.3.Input parameters

The xd read zone file CFI function has the following input parameters:

Table 63: Input parameters of xd\_read\_zone\_file function

| C name    | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|----------------------------|------------------|---------------|
| file_name | char*  | -                | Zone database file name    | -                | -             |

# 7.28.4. Output parameters

The output parameters of the **xd\_read\_zone\_file** CFI function are:

125

Page:

Table 64: Output parameters of xd\_read\_zone\_file function

| C name            | C type    | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-------------------|-----------|------------------|---|------------------|---------------|
| xd_read_zone_file | long      |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | _                | -             |
| xd_zone_file      | zone_data |                  | Structure containing the data for all the zones read from the file  | _                | -             |
| ierr              | long[]    | -                | Error vector  | -                | -             |

<u>Memory Management</u>: The *zone\_data* structure contains pointers to memory allocated dynamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd free zone file**.

#### 7.28.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_zone\_file** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_zone\_file** function by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_code** (see [GEN\_SUM])

Table 65: Error messages of xd\_read\_zone\_file function

| Error type | Error message                  | Cause and impact         | Error code   | Error<br>No |
|------------|--------------------------------|--------------------------|--|-------------|
| ERR        | Zone File not found.           | ·                        | XD_CFI_READ_ZONE_FIL<br>E_INIT_PARSER_ERR              | 0           |
| ERR        | Data Block not found           | •                        | XD_CFI_READ_ZONE_FIL<br>E_DATA_BLOCK_ERR               | 1           |
| ERR        | Data Block attribute not read. | No calculation performed | XD_CFI_READ_ZONE_FIL<br>E_DATA_BLOCK_ATTRIBU<br>TE_ERR | 2           |

# 7.29. xd\_free\_zone\_file

#### 7.29.1.0verview

The **xd\_free\_zone\_file** CFI function frees the memory allocated during the reading function xd read zone file.

# 7.29.2. Calling interface

The calling interface of the **xd\_free\_zone\_file** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  xd_zone_file zone_data;
  xd_free_zone_file (&zone_data);
}
```

### 7.29.3.Input parameters

The xd\_free\_zone\_file CFI function has the following input parameters:

Table 66: Input parameters of xd\_free\_zone\_file function

| C name    | C type       | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------------|------------------|----------------------------|------------------|---------------|
| zone_data | xd_zone_file | _                | Zone file data structure   | -                | -             |

# 7.29.4. Output parameters

This function does not return any value nor parameters.

128

Page:

# 7.30.xd\_read\_zone\_id

#### 7.30.1.0verview

The **xd\_read\_zone\_id** CFI function reads the list of zone names (Id) in a zone database file for Earth Observation Missions.

### 7.30.2. Calling interface

The calling interface of the **xd\_read\_zone\_id** CFI function is the following (input parameters are <u>underlined</u>):

# 7.30.3.Input parameters

The xd read zone id CFI function has the following input parameters:

Table 67: Input parameters of xd\_read\_zone\_id function

| C name    | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|----------------------------|------------------|---------------|
| file_name | char*^ | -                | Zone database file name    | -                | -             |

# 7.30.4. Output parameters

The output parameters of the xd read zone id CFI function are:

Page: 129

Table 68: Output parameters of xd\_read\_zone\_id function

| C name          | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-----------------|--------|------------------|---|------------------|---------------|
| xd_read_zone_id | long   |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated |                  | _             |
| num_zones       | long   | I                | Number of zones in the input file   | -                | -             |
| zone_ids        | char** | I                | List fo zone names in the file  | -                | -             |
| ierr            | long[] | -                | Error vector  | -                | -             |

<u>Memory Management</u>: The *zone\_ids* is a double pointer to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data is not to be used any more. The memory can be freed by calling to the CFI function **xd\_free\_zone\_id**.

### 7.30.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_zone\_id** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_zone\_id** function by calling the function of the EO\_DATA\_HANDLING software library **xd get code** (see [GEN SUM])

Table 69: Error messages of xd\_read\_zone\_id function

| Error<br>type | Error message                     | Cause and impact         | Error code                                  | Error<br>No |
|---------------|-----------------------------------|--------------------------|---|-------------|

# 7.33.xd\_read\_station\_file

#### 7.33.1.0verview

The xd read station file CFI function reads a whole station file for Earth Observation Missions.

# 7.33.2. Calling interface

The calling interface of the xd\_read\_station\_file CFI function is the following (input parameters are underlined):

```
#include <explorer data handling.h>
 long status;
 char *file name;
 xd station file station data;
 long ierr[XD NUM ERR READ ];
 status = xd read station file (file name,
                                 &station data, ierr);
}
```

# 7.33.3.Input parameters

The xd read station file CFI function has the following input parameters:

Table 74: Input parameters of xd\_read\_station\_file function

| C name    | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|----------------------------|------------------|---------------|
| file_name | char*  | -                | Station database file name | -                | -             |

# 7.33.4. Output parameters

The output parameters of the xd\_read\_station\_file CFI function are:

Table 75: Output parameters of xd\_read\_station\_file function

| C name               | C type          | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|----------------------|-----------------|------------------|---|------------------|---------------|
| xd_read_station_file | long            |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                | -             |
| station_data         | xd_station_file | -                | Station file data structure   | -                | -             |
| ierr                 | long[]          | -                | Error vector  | -                | -             |

<u>Memory Management</u>: The *station\_data* structure contains pointers to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd free station file**.

# 7.33.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_station\_file** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_station\_file** function by calling the function of the EO DATA HANDLING software library **xd\_get\_code** (see [GEN SUM])

Table 76: Error messages of xd\_read\_station\_file function

| Error type | Error message                      | Cause and impact         | Error code  | Error<br>No |

# 7.34.xd\_free\_station\_file

#### 7.34.1.0verview

The **xd\_free\_station\_file** CFI function frees the memory allocated during the reading function xd read station file.

# 7.34.2. Calling interface

The calling interface of the **xd\_free\_station\_file** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  xd_station_file station_data;
  xd_free_station_file (&station_data);
}
```

### 7.34.3.Input parameters

The xd free station file CFI function has the following input parameters:

Table 77: Input parameters of xd\_free\_station\_file function

| C name | C type              | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|--------|---------------------|------------------|-----------------------------|------------------|---------------|
|        | xd_station_f<br>ile | -                | Station file data structure | -                | -             |

# 7.34.4.Output parameters

This function does not return any value nor parameters.

# 7.35, xd\_read\_station\_id

#### 7.35.1.0verview

The **xd\_read\_station\_id** CFI function reads the list of station names (Id) contained in a station database file.

# 7.35.2. Calling interface

The calling interface of the **xd\_read\_station\_id** CFI function is the following (input parameters are underlined):

```
#include <explorer_data_handling.h>
{
  long status, num_stations;
  char *file_name;
  char **station_list;
  long ierr[XD_NUM_ERR_READ_STATION_ID];

  status = xd_read_station_id (file_name, &num_stations, &station_list, ierr);
}
```

# 7.35.3.Input parameters

The xd read station id CFI function has the following input parameters:

Table 78: Input parameters of xd\_read\_station\_id function

| C name    | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|----------------------------|------------------|---------------|
| file_name | char*  | -                | Station database file name | -                | -             |

# 7.35.4. Output parameters

The output parameters of the xd\_read\_station\_id CFI function are:

Table 79: Output parameters of xd\_read\_station\_id function

| C name             | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|--------------------|--------|------------------|---|------------------|---------------|
| xd_read_station_id | long   |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                | -             |
| num_stations       | long   | -                | Number of stations  | -                | -             |
| station_list       | char** | -                | Station list name   | -                | -             |
| ierr               | long[] | -                | Error vector  | -                | -             |

<u>Memory Management</u>: The *station\_list* is a double pointer to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data is not to be used any more. The memory can be freed by calling to the CFI function **xd\_free\_station\_id**.

#### 7.35.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_station\_id** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_station\_id** function by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_code** (see [GEN\_SUM])

Table 80: Error messages of xd\_read\_station\_id function

| Error type | Error message                       | Cause and impact         | Error code                                  | Error<br>No |
|------------|-------------------------------------|--------------------------|---|-------------|
| ERR        | Ground Station DB File not found.   | No calculation performed | XD_CFI_READ_STATION_I<br>D_INIT_PARSER_ERR  | 0           |
| ERR        | Data Block not found.               | No calculation performed | XD_CFI_READ_STATION_I<br>D_DATA_BLOCK_ERR   | 1           |
| ERR        | List_of_Ground_Stations not found.  | No calculation performed | XD_CFI_READ_STATION_I<br>D_LIST_GS_READ_ERR | 2           |
| ERR        | Number of ground stations negative. | No calculation performed | XD_CFI_READ_STATION_I<br>D_LIST_GS_SIZE_ERR | 3           |
| ERR        | Error allocating memory             | No calculation performed | XD_CFI_READ_STATION_I<br>D_MEM_ERR          | 4           |

# 7.36.xd\_free\_station\_id

#### 7.36.1.0verview

The **xd\_free\_station\_id** CFI function frees the memory allocated during the reading function xd read station id.

# 7.36.2. Calling interface

The calling interface of the **xd\_free\_station\_id** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  char **station_ids;
  xd_free_station_id (&station_ids);
}
```

### 7.36.3.Input parameters

The xd\_free\_station\_id CFI function has the following input parameters:

Table 81: Input parameters of xd\_free\_station\_id function

| C name      | C type  | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-------------|---------|------------------|----------------------------|------------------|---------------|
| station_ids | char ** | -                | Station Id list            | _                | -             |

# 7.36.4. Output parameters

This function does not return any value nor parameters.

Page: 143

# 7.37. xd\_read\_star

#### 7.37.1.0verview

The xd\_read\_star CFI function reads the data for a star from a star database file.

# 7.37.2. Calling interface

The calling interface of the xd\_read\_star CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  char *file_name, star_id;
  xd_star_rec star_data;
  long ierr[XD_NUM_ERR_READ_STAR];

  status = xd_read_star (file_name, star_id, &star_data, ierr);
}
```

# 7.37.3.Input parameters

The xd\_read\_star CFI function has the following input parameters:

Table 82: Input parameters of xd\_read\_star function

| C name    | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|----------------------------|------------------|---------------|
| file_name | char*  | -                | Star database file name    | -                | -             |
| star_id   | char*  | -                | Star name (Id) to be read  | -                | -             |

# 7.37.4. Output parameters

The output parameters of the xd\_read\_star CFI function are:

Table 83: Output parameters of xd\_read\_star function

| C name       | C type      | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|--------------|-------------|------------------|---|------------------|---------------|
| xd_read_star | long        |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | _                | -             |
| star_data    | xd_star_rec | -                | Star data structure   | -                | -             |
| ierr         | long[]      | -                | Error vector  | -                | -             |

### 7.37.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_star** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd\_get\_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_star** function by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_code** (see [GEN\_SUM])

Table 84: Error messages of xd\_read\_star function

| Error type | Error message                                   | Cause and impact | Error code                              | Error<br>No |
|------------|---|------------------|---|-------------|
| ERR        | Star database file not found:<br>%s             |                  | XD_CFI_READ_STAR_FIL<br>E_NOT_FOUND_ERR | 0           |
| F          | star id. %s not found in the star database file | ·                | XD_CFI_READ_STAR_STA<br>R_NOT_FOUND_ERR | 1           |

# 7.38. xd\_read\_star\_file

#### 7.38.1.0verview

The xd\_read\_star\_file CFI function reads a star database file for Earth Observation Missions.

## 7.38.2. Calling interface

The calling interface of the **xd\_read\_star\_file** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  char *file_name;
  xd_star_file star_data;
  long ierr[XD_NUM_ERR_READ_STAR_FILE];

  status = xd_read_star_file (file_name, &star_data, ierr);
}
```

# 7.38.3.Input parameters

The xd read star file CFI function has the following input parameters:

Table 85: Input parameters of xd\_read\_star\_file function

|   | C name   | C type | Array<br>Element | Description<br>(Reference)          | Unit<br>(Format) | Allowed Range |
|---|----------|--------|------------------|-------------------------------------|------------------|---------------|
| f | ile_name | char*  | -                | Star database file name (full path) | -                | -             |

## 7.38.4. Output parameters

The output parameters of the xd\_read\_star\_file CFI function are:

Table 86: Output parameters of xd\_read\_star\_file function

| C name            | C type       | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-------------------|--------------|------------------|---|------------------|---------------|
| xd_read_star_file | long         |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                | -             |
| star_data         | xd_star_file | -                | Star file structure   | -                | -             |
| ierr              | long[]       | -                | Error vector  | -                | -             |

<u>Memory Management</u>: The *star\_data* structure contains pointers to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd free star file**.

## 7.38.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_star\_file** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_star\_file** function by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_code** (see [GEN\_SUM])

Table 87: Error messages of xd\_read\_star\_file function

| Error<br>type | Error message                                  | Cause and impact | Error code                                    | Error<br>No |
|---------------|--|------------------|---|-------------|
| ERR           | Could not open the Star data-<br>base file: %s |                  | XD_CFI_READ_STAR_FIL<br>E_FILE_NOT_FOUND_ER R | 0           |
| ERR           | Error allocating memory                        |                  | XD_CFI_READ_STAR_FIL<br>E_MEMORY_ERR          | 1           |
| ERR           | No stars found in file                         | ·                | XD_CFI_READ_STAR_FIL<br>E_NO_STARS_ERR        | 2           |

# 7.39.xd\_read\_star\_id

#### 7.39.1.0verview

The xd read star id CFI function reads the list of star names from star database files.

### 7.39.2. Calling interface

The calling interface of the **xd\_read\_star\_id** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  char *file_name;
  char **star_list;
  long num_stars;
  long ierr[XD_NUM_ERR_READ_STAR_ID];

status = xd_read_star_id (file_name, &num_stars, &star_list, ierr);
}
```

# 7.39.3.Input parameters

The xd\_read\_star\_id CFI function has the following input parameters:

Table 88: Input parameters of xd\_read\_star\_id function

| C name    | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|----------------------------|------------------|---------------|
| file_name | char*  | -                | Star database file         | -                | -             |

## 7.39.4. Output parameters

The output parameters of the xd read star id CFI function are:

Table 89: Output parameters of xd\_read\_star\_id function

| C name          | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-----------------|--------|------------------|-----------------------------|------------------|---------------|
| xd_read_star_id | long   |                  | Function status flag:       | -                | -             |
| num_stars       | long   | -                | Number of stars in the file | -                | > 0           |
| star_list       | char** | -                | Array of star names         | -                | -             |
| ierr            | long[] | -                | Error vector                | -                | -             |

<u>Memory Management</u>: The *star\_list* is a double pointer to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data is not to be used any more. The memory can be freed by calling to the CFI function **xd\_free\_star\_id**.

#### 7.39.5. Warnings and errors

Next table lists the possible error messages that can be returned by the xd\_read\_star\_id CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library xd get msg (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_star\_id** function by calling the function of the EO\_DATA\_HANDLING software library **xd get code** (see [GEN SUM])

Table 90: Error messages of xd\_read\_star\_id function

| Error type | Error message                             | Cause and impact | Error code                                 | Error<br>No |
|------------|---|------------------|--|-------------|
| ERR        | Could not open the Star database file: %s |                  | XD_CFI_READ_STAR_ID_<br>FILE_NOT_FOUND_ERR | 0           |
| ERR        | Error allocating memory                   |                  | XD_CFI_READ_STAR_ID_<br>MEMORY_ERR         | 1           |
| ERR        | No stars found in file                    |                  | XD_CFI_READ_STAR_ID_<br>NO_STARS_ERR       | 2           |

# 7.40. xd\_read\_tle

#### 7.40.1.0verview

The xd\_read\_tle CFI function read a TLE file.

## 7.40.2. Calling interface

The calling interface of the xd\_read\_tle CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  char *file_name, satellite;
  xd_tle_file tle_data;
  long ierr[XD_NUM_ERR_READ_TLE];

  status = xd_read_tle(file_name, satellite, &tle_data, ierr);
}
```

## 7.40.3.Input parameters

The xd\_read\_tle CFI function has the following input parameters:

Table 91: Input parameters of xd\_read\_tle function

| C name    | C type | Array<br>Element | Description<br>(Reference)   | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|--|------------------|---------------|
| file_name | char*  | -                | File name for the orbit file.  | -                | -             |
| satellite | char*  |                  | Satellite name as it appears in line 0 for a TLE. If it is an empty string ("") or NULL, all the TLE are read, other way only the TLE for this satellite are read. | -                | -             |

# 7.40.4. Output parameters

The output parameters of the xd\_read\_tle CFI function are:

Table 92: Output parameters of xd\_read\_tle function

| C name      | C type      | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-------------|-------------|------------------|---|------------------|---------------|
| xd_read_tle | long        |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                | -             |
| tle_data    | xd_tle_file | -                | Orbital state vectors data structure  | -                | _             |
| ierr        | long[]      | -                | Error vector  | -                | _             |

<u>Memory Management</u>: The *tle\_data* is a pointer to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data is not to be used any more. The memory can be freed by calling to the CFI function **xd\_free\_tle**.

#### 7.40.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_tle** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd\_get\_msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_tle** function by callingthe function of the EO\_DATA\_HANDLING software library **xd\_get\_code** (see [GEN\_SUM])

Table 93: Error messages of xd read tle function

# 7.42.xd\_read\_precise\_propag\_file

#### 7.42.1.0verview

The xd read precise propag file CFI function read a configuration file for precise propagation.

### 7.42.2. Calling interface

The calling interface of the xd read precise propag file CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer data handling.h>
 long status;
 char *file name;
 xd propag precise config precise conf;
 long ierr[XD NUM ERR READ PRECISE PROPAG];
 status = xd read precise propag file (file name,
                                       &precise conf, ierr);
```

# 7.42.3.Input parameters

The xd read precise propag CFI function has the following input parameters:

Table 95: Input parameters of xd\_read\_precise\_propag function

| C name    | C type | Array<br>Element | Description<br>(Reference)    | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|-------------------------------|------------------|---------------|
| file_name | char*  | -                | File name for the orbit file. | -                | _             |

## 7.42.4. Output parameters

The output parameters of the xd read precise propag CFI function are:

Table 96: Output parameters of xd\_read\_precise\_propag function

| C name                     | C type                           | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |

#### 7.42.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_precise\_propag** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_precise\_propag** function bycalling the function of the EO DATA HANDLING software library **xd get code** (see [GEN SUM])

Table 97: Error messages of xd\_read\_precise\_propag function

| Error type | Error message                              | Cause and impact | Error code  | Error<br>No |
|------------|--|------------------|---|-------------|
| ERR        | Could not open file                        | File not read    | XD_CFI_READ_PRECISE_<br>PROPAG_INIT_PARSER_E<br>RR    | 0           |

# 7.43.xd\_read\_att\_def

#### 7.43.1.0verview

The xd read att def CFI function reads a whole attitude definition file.

The description of the output struct can be found in table 3.

The detailed description of the Attitude Definition File can be found in section Error: Reference source not found.

## 7.43.2. Calling interface

The calling interface of the xd\_read\_att\_def CFI function is the following (input parameters are underlined):

```
#include <explorer data handling.h>
 long status;
 char *file name;
 xd attitude definition data att data;
 long ierr[XD NUM ERR READ_ATT_DEF];
 status = xd read att def (file name,
                            &att data, ierr);
}
```

# 7.43.3.Input parameters

The xd read att def CFI function has the following input parameters:

Table 98: Input parameters of xd\_read\_att\_def function

| C name    | C type | Array<br>Element | Description<br>(Reference)    | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|-------------------------------|------------------|---------------|
| file_name | char*  | -                | Attitude definition file name | -                | -             |

# 7.43.4. Output parameters

The output parameters of the xd read att def CFI function are:

Issue: 4.17 Page: 157

Table 99: Output parameters of xd\_read\_att\_def function

| C name          | C type                          | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-----------------|---------------------------------|------------------|---|------------------|---------------|
| xd_read_att_def | long                            |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated |                  | -             |
| att_data        | xd_attitude_defi<br>nition_data |                  | Attitude definition data<br>structure   | -                | -             |
| ierr            | long[]                          | -                | Error vector  | -                | -             |

<u>Memory Management</u>: The <u>att\_data</u> structure contains pointers to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd\_free\_att\_def**.

#### 7.43.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_att\_def** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_att\_def** function by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_code** (see [GEN\_SUM])

Table 100: Error messages of xd\_read\_att\_def function

| Error type | Error message                               | Cause and impact      | Error code                                | Error<br>No |
|------------|---|-----------------------|---|-------------|
| ERR        | Error opening file                          |                       | XD_CFI_READ_ATT_DEF_<br>OPEN_FILE_ERR     | 0           |

4.17 158

# 7.44.xd\_free\_att\_def

#### 7.44.1.0verview

The **xd\_free\_att\_def** CFI function frees the memory allocated during the reading function xd read att def.

## 7.44.2. Calling interface

The calling interface of the **xd\_free\_att\_def** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
   xd_attitude_definition_data att_data;
   xd_free_att_def (&att_data);
}
```

# 7.44.3.Input parameters

The xd free att def CFI function has the following input parameters:

Table 101: Input parameters of xd\_free\_att\_def function

| C name   | C type                              | Array<br>Element | Description<br>(Reference)              | Unit<br>(Format) | Allowed Range |
|----------|-------------------------------------|------------------|---|------------------|---------------|
| <b>–</b> | xd_attitude_<br>definition_d<br>ata | -                | Attitude definition file data structure | -                | -             |

# 7.44.4.Output parameters

This function does not return any value nor parameters.

Page:

159

# 7.45.xd\_read\_sp3

#### 7.45.1.0verview

The xd read sp3 CFI function reads a Standard Product 3 C (SP3-C) File.

The description of the output struct (xd sp3 file) can be found in table 3.

The detailed description of the SP3 file can be found in section Error: Reference source not found.

The following items must be considered when reading a SP3 file:

- 1) SP3 file does not provide information about the orbit number.
- 2) The xd\_read\_sp3 function extracts file common information and only Orbit State Vectors for satellites (see output struct xd sp3 file).
- 3) The following time conversions are performed, depending on the SP3 file time system:
  - If time system is GPS (identifier GPS), GALILEO (identifier GAL) or QZSS (identifier GZS), the times are converted to TAI, taking into account that TAI time is equal to GPS/GALILEO/QZSS time plus 19 seconds. Since no time correlation is provided, TAI-UTC and UT1-UTC differences are set to zero.
  - If time system is GLONASS (identifier GLO), the times are converted to UTC, taking into account that UTC time is equal to GLONASS time minus 3 hours. Since no time correlation is provided, TAI-UTC and UT1-UTC differences are set to zero.
  - If time system is TAI (identifier TAI) or UTC (identifier UTC), the times are taken as they are in the corresponding time reference system. Since no time correlation is provided, TAI-UTC and UT1-UTC differences are set to zero.
- 4) The Orbit State Vectors are recorded in output struct following the satellite order found in SP3 file. For example, if the identifiers of the satellites are G01G02G04, the corresponding OSVs information are (taking into account that this information is stored in the field osv\_rec\_sp3 of xd\_sp3\_file):
  - For G01: osv\_rec\_sp3[0]
  - For G02: osv\_rec\_sp3[1]
  - For G04: osv rec sp3[2]

Note that the position in array corresponds to position in satellite list, not in the satellite identifier number.

- 5) A warning is raised if at least one of the following conditions is detected:
  - OSV with time going back
  - OSV with repeated time

## 7.45.2. Calling interface

The calling interface of the xd read sp3 CFI function is the following (input parameters are <u>underlined</u>):

Issue: 4.17 Page: 160

## 7.45.3.Input parameters

The xd\_read\_sp3 CFI function has the following input parameters:

Table 102: Input parameters of xd\_read\_sp3 function

| C name    | C type                                      | Array<br>Element | Description<br>(Reference)                  | Unit<br>(Format) | Allowed Range |
|-----------|---|------------------|---|------------------|---------------|
| file_name | char*                                       | -                | SP3 file name                               | -                | -             |
|           | xd_osv_<br>list_read<br>_configu<br>ration* |                  | Configuration for reading OSV state vectors | -                | -             |

## 7.45.4. Output parameters

The output parameters of the xd\_read\_sp3 CFI function are:

Table 103: Output parameters of xd\_read\_sp3 function

| C name C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|---------------|------------------|----------------------------|------------------|---------------|
|---------------|------------------|----------------------------|------------------|---------------|

| xd_read_sp3 | long        |   | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | - | _ |
|-------------|-------------|---|---|---|---|
| Sp3_data    | xd_sp3_file | - | SP3 file structure  | - | - |
| ierr        | long[]      | - | Error vector  | - | - |

<u>Memory Management</u>: The *sp3\_data* structure contains pointers to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd** free **sp3**.

### 7.45.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_sp3** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_sp3** function by calling the function of the EO\_DATA\_HANDLING software library **xd get code** (see [GEN SUM])

Table 104: Error messages of xd\_read\_sp3 function

| Error type | Error message                         | Cause and impact         | Error code                                 | Error<br>No |

# 7.46.xd\_free\_sp3

#### 7.46.1.0verview

The xd\_free\_sp3 CFI function frees the memory allocated during the reading function xd\_read\_sp3.

## 7.46.2. Calling interface

The calling interface of the xd\_free\_sp3 CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  xd_sp3_file sp3_data;
  xd_free_sp3 (&sp3_data);
}
```

## 7.46.3.Input parameters

The xd\_free\_sp3 CFI function has the following input parameters:

Table 105: Input parameters of xd\_free\_sp3 function

| C name   | C type      | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|----------|-------------|------------------|----------------------------|------------------|---------------|
| sp3_data | xd_sp3_file | -                | SP3 file structure         | -                | -             |

# 7.46.4. Output parameters

This function does not return any value nor parameters.

## 7.48. xd\_write\_orbit\_file

#### 7.48.1.0verview

The **xd\_write\_orbit\_file** CFI function writes an orbit file in XML format using the data structure provided by the user. The orbit file can be either:

- A Predicted orbit file
- A Restituted orbit file
- A DORIS Predicted file
- The Time\_Reference and Ref\_Frame fields in the variable header of the orbit file are filled according to the parameters time\_ref\_of and ref\_frame in the OSV records. Therefore it is required that all OSVs contained in xd\_orbit\_file have the same time reference and reference frame.

#### 7.48.2. Calling interface

The calling interface of the **xd\_write\_orbit\_file** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  char *file_name;
  xd_fhr fhr;
  xd_orbit_file *osv_data;
  long ierr[XD_NUM_ERR_WRITE_ORBIT_FILE];

  status = xd_write_orbit_file(file_name, &fhr, &osv_data, ierr);
}
```

## 7.48.3.Input parameters

The xd write orbit file CFI function has the following input parameters:

Table 109: Input parameters of xd\_write\_orbit\_file function

| C name    | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-----------|--------|------------------|---|------------------|---------------|
| file_name | char*  |                  | File name for the orbit file. If empty string (i.e, ""), then the file is written with the name in the fixed_header structure (fhr) | _                | -             |
| fhr       | xd_fhr | -                | Fixed header structure  | -                | -             |

| xd_orbit_file | osv_data | - | Orbital state vectors data struc- | - | - |
|---------------|----------|---|-----------------------------------|---|---|
|               |          |   | ture                              |   |   |

#### 7.48.4.Output parameters

The output parameters of the xd write orbit file CFI function are:

Table 110: Output parameters of xd\_write\_orbit\_file function

| C name              | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|---------------------|--------|------------------|---|------------------|---------------|
| xd_write_orbit_file | long   |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated |                  | -             |
| ierr                | long[] | -                | Error vector  | _                | -             |

#### 7.48.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_write\_orbit\_file** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_write\_orbit\_file** function by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_code** (see [GEN\_SUM])

Table 111: Error messages of xd\_write\_orbit\_file function

| Error type | Error message                                   | Cause and impact         | Error code                                     | Error<br>No |
|------------|---|--------------------------|--|-------------|
| ERR        | Cannot create root element                      | No calculation performed | XD_CFI_WRITE_ORBIT_FI<br>LE_CREATE_TREE_ERR    | 0           |

# 7.49. xd\_write\_osf

#### 7.49.1.0verview

The **xd\_write\_osf** CFI function writes an Orbit Scenario file in XML format using the data provided by the user.

#### 7.49.2. Calling interface

The calling interface of the **xd\_write\_osf** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  char *file_name;
  xd_fhr fhr;
  xd_osf_file osf_data;
  long ierr[XD_NUM_ERR_WRITE_OSF];

  status = xd_write_osf (file_name, &fhr, &osf_data, ierr);
}
```

# 7.49.3.Input parameters

The **xd\_write\_osf** CFI function has the following input parameters:

Table 112: Input parameters of xd\_write\_osf function

| C name      | C type   | Array<br>Element | Description<br>(Reference)   | Unit<br>(Format) | Allowed Range |
|-------------|----------|------------------|--|------------------|---------------|
| file_name   | char*    |                  | File name for the orbit scenario file. If empty string (i.e, ""), then the file is written with the name in the fixed_header structure (fhr) |                  | -             |
| fhr         | xd_fhr   | -                | Fixed header structure   | -                | -             |
| xd_osf_file | osf_data | -                | Orbital changes data structure   | -                | -             |

# 7.49.4. Output parameters

The output parameters of the **xd\_write\_osf** CFI function are:

Table 113: Output parameters of xd\_write\_osf function

| C name       | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|--------------|--------|------------------|---|------------------|---------------|
| xd_write_osf | long   |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated |                  | -             |
| ierr         | long[] | _                | Error vector  | -                | -             |

### 7.49.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_write\_osf** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_write\_osf** function by calling the function of the EO\_DATA\_HANDLING software library **xd get code** (see [GEN SUM])

Table 114: Error messages of xd\_write\_osf function

| Error type | Error message                                   | Cause and impact                        | Error code                                | Error<br>No |

# 7.50.xd\_write\_doris

#### 7.50.1.0verview

The **xd\_write\_doris** CFI function writes a DORIS NAVIGATOR Product file for CRYOSAT, using the data provided by the user.

#### 7.50.2. Calling interface

The calling interface of the **xd\_write\_doris** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  char *file_name;
  xd_doris_mph_sph fhr;
  xd_doris_file doris_data;
  long ierr[XD_NUM_ERR_WRITE_DORIS];

  status = xd_write_doris (file_name, &fhr, &doris_data, ierr);
}
```

## 7.50.3.Input parameters

The xd write doris CFI function has the following input parameters:

Table 115: Input parameters of xd\_write\_doris function

| C name     | C type               | Array<br>Element | Description<br>(Reference)             | Unit<br>(Format) | Allowed Range |
|------------|----------------------|------------------|--|------------------|---------------|

# 7.51.xd\_write\_stf

#### 7.51.1.0verview

The xd write stf CFI function writes a swath template file XML format using the data provided by the user.

## 7.51.2. Calling interface

The calling interface of the **xd** write **stf** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer data handling.h>
 long status;
 char *file name;
 xd fhr fhr;
 xd stf file stf data;
 long ierr[XD NUM ERR WRITE STF];
 status = xd write stf (file name, &fhr, &stf data, ierr);
```

# 7.51.3.Input parameters

The xd\_write\_stf CFI function has the following input parameters:

Table 118: Input parameters of xd\_write\_stf function

| C name      | C type       | Array<br>Element | Description<br>(Reference)   | Unit<br>(Format) | Allowed Range |
|-------------|--------------|------------------|--|------------------|---------------|
| file_name   | char*        |                  | File name for the swath template file. If empty string (i.e, ""), then the file is written with the name in the fixed_header structure (fhr) | -                | -             |
| fhr         | xd_fhr       | -                | Fixed header structure   | -                | -             |
| xd_stf_file | stf_dat<br>a | -                | STF data structure   | -                | -             |

| WARN       | Cannot write schema in the file                             | File written to disk but without schema | XD_CFI_WRITE_STF_SET<br>_SCHEMA_WARN      | 8           |

Page: 175

## 7.52.xd\_write\_att

#### 7.52.1.0verview

The **xd\_write\_att** CFI function writes an attitude generic file in XML format using the data provided by the user.

Note about output format: the number of decimal digits written to file depends on the type of data:

- •If angles are used, 6 decimal digits are written.
- •If quaternions are used, 9 decimal digits are written.

It is done this way because having 9 decimal digits in quaternions reduces pointing error significantly.

## 7.52.2. Calling interface

The calling interface of the **xd** write att CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  char *file_name;
  xd_fhr fhr;
  xd_att_file att_data;
  long ierr[XD_NUM_ERR_WRITE_ATT];

status = xd_write_att (file_name, &fhr, &att_data, ierr);
}
```

## 7.52.3.Input parameters

The xd write att CFI function has the following input parameters:

Table 121: Input parameters of xd\_write\_att function

| C name      | C type       | Array<br>Element | Description<br>(Reference)   | Unit<br>(Format) | Allowed Range |
|-------------|--------------|------------------|--|------------------|---------------|
| file_name   | char*        |                  | File name for the attitude file. If empty string (i.e, ""), then the file is written with the name in the fixed_header structure (fhr) | -                | -             |
| fhr         | xd_fhr       | -                | Fixed header structure   | -                | -             |

#### 7.52.4. Output parameters

The output parameters of the **xd\_write\_att** CFI function are:

Table 122: Output parameters of xd\_write\_att function

| C name       | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|--------------|--------|------------------|---|------------------|---------------|
| xd_write_att | long   |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                | -             |
| ierr         | long[] | -                | Error vector  | -                | -             |

### 7.52.5. Warnings and errors

Next table lists the possible error messages that can be returned by the xd write att CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library xd get msg (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the xd write att function by calling the function of the EO DATA HANDLING software library xd get code (see [GEN SUM])

Table 123: Error messages of xd\_write\_att function

| Error type | Error message                                   | Cause and impact         | Error code                              | Error<br>No |
|------------|---|--------------------------|---|-------------|
| ERR        | Cannot create in-memory<br>XML tree             |                          | XD_CFI_WRITE_ATT_CRE<br>ATE_TREE_ERR    | 0           |
| ERR        | Cannot create root element                      |                          | XD_CFI_WRITE_ATT_CRE<br>ATE_ROOT_ERR    | 1           |
| ERR        | Cannot write the fixed header                   |                          | XD_CFI_WRITE_ATT_WRI<br>TE_FHR_ERR      | 2           |

# 7.53.xd\_write\_tle

#### 7.53.1.0verview

The **xd\_write\_tle** CFI function writes a TLE file. The data to be written are in the input structure except for the checksum, that it is computed for every line.

### 7.53.2. Calling interface

The calling interface of the **xd** write tle CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  char *file_name;
  xd_tle_file tle_data;
  long ierr[XD_NUM_ERR_WRITE_TLE]

  status = xd_write_tle (file_name, &tle_data, ierr);
}
```

# 7.53.3.Input parameters

The **xd\_write\_tle** CFI function has the following input parameters:

Table 124: Input parameters of xd\_write\_tle function

| C name      | C type       | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-------------|--------------|------------------|-----------------------------|------------------|---------------|
| file_name   | char*        | -                | File name for the TLE file. | -                | -             |
| xd_tle_file | tle_dat<br>a | -                | TLE data structure          | -                | -             |

# 7.53.4. Output parameters

The output parameters of the **xd\_write\_tle** CFI function are:

Code: EO-MA-DMS-GS-0007 Date: 10/05/2019

Issue: 4.17 Page: 178

Table 125: Output parameters of xd\_write\_tle function

| C name       | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|--------------|--------|------------------|---|------------------|---------------|
| xd_write_tle | long   |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated |                  | -             |
| ierr         | long[] | -                | Error vector  | -                | -             |

### 7.53.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_write\_tle** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_write\_tle** function by calling the function of the EO\_DATA\_HANDLING software library **xd get code** (see [GEN SUM])

Table 126: Error messages of xd\_write\_tle function

| Error type | Error message                               | Cause and impact         | Error code                     | Error<br>No |
|------------|---|--------------------------|--------------------------------|-------------|
| ERR        | Could not open the TLE file for writing: %s | '                        | XD_WRITE_TLE_FILE_OP<br>EN_ERR | 0           |
| ERR        | Could not write the TLE file:<br>%s         | No calculation performed | XD_WRITE_TLE_WRITE_E<br>RR     | 1           |

# 7.54.xd\_write\_att\_def

#### 7.54.1.0verview

The xd\_write\_att\_def CFI function writes a Attitude Definition File.

The description of the input struct can be found in table 3.

The detailed description of the Attitude Definition File can be found in section Error: Reference source not found.

## 7.54.2. Calling interface

The calling interface of the **xd\_write\_att\_def** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  char *file_name;
  xd_attitude_definition_data att_data;
  long ierr[XD_NUM_ERR_WRITE_ATT_DEF];

  status = xd_write_att_def (file_name, &fhr, &att_data, ierr);
}
```

# 7.54.3.Input parameters

The xd write att def CFI function has the following input parameters:

Table 127: Input parameters of xd\_write\_att\_def function

| C name    | C type                                  | Array<br>Element | Description<br>(Reference)         | Unit<br>(Format) | Allowed Range |
|-----------|---|------------------|------------------------------------|------------------|---------------|
| file_name | char*                                   | -                | File name.                         | -                | -             |
| fhr       | xd_fhr                                  | -                | Fixed header                       |                  |               |

# 7.55.xd\_xml\_validate

#### 7.55.1.0verview

The xd xml validate CFI function validates an XML file using its XML schema and checks the XML schema versioning.

### 7.55.2. Calling interface

The calling interface of the CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer data handling.h>
 long status, valid status;
 char *filename, *schema, *logfile;
 long mode;
 long ierr[XD NUM ERR XML VALIDATE];
 status = xd xml validate (filename, &mode, schema, logfile,
                            &valid status, ierr);
```

## 7.55.3.Input parameters

The xd\_xml\_validate CFI function has the following input parameters:

Table 130: Input parameters of xd\_xml\_validate function

| C name   | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed<br>Range |
|----------|--------|------------------|---|------------------|------------------|
| filename | char*  | -                | File name to validate   | -                | -                |
| mode     | long   |                  | Flag to select the schema to be used to validate the file. It can be either:  • XD_DEFAULT_SCHEMA: use the schema that is in the root element of the XML file. or  • XD_USER_SCHEMA: use the schema given in the schema parameter in the interface. | -                | -                |
| schema   | char*  |                  | Schema file. The schema can be given as an absolute path or as a relative path from the file's directory (No the current directory)   | -                | -                |

| logfile | char* | - | Log file (file path). It is used to store the messages | - | - |
|---------|-------|---|--|---|---|
|         |       |   | returned by the validation process. The result of the  |   |   |
|         |       |   | validation can be seen at the end of the log in the    |   |   |
|         |       |   | following message:                                     |   |   |
|         |       |   | Validation result for "filename": [VALID]/[INVALID]    |   |   |

#### 7.55.4. Output parameters

The output parameters of the xd\_xml\_validate CFI function are:

Table 131: Output parameters of xd\_xml\_validate function

| C name          | C type | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-----------------|--------|------------------|---|------------------|---------------|
| xd_xml_validate | long   |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                | -             |
| valid_status    | long   |                  | The result of the validation:  • XD_XML_INVALID (= -1)  • XD_XML_VALID (= 0)                                | -                | -             |
| ierr            | long[] | -                | Error vector  | -                | -             |

## 7.55.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_xml\_validate** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_xml\_validate** function by calling the function of the EO\_DATA\_HANDLING software library **xd get code** (see [GEN SUM])

Table 132: Error messages of xd\_xml\_validate function

| Error type | Error message                 | Cause and impact  | Error code  | Error<br>No |
|------------|-------------------------------|---|-------------|-------------|
|            | the XML file Severe errors in | The file is not well formed and cannot be opened because of severe errors. No calculation performed | . – – – – , | 0           |

# 7.55.6.Executable program

An XML file can also be validated using the executable program **xml\_validate**. It can be called from a Unix shell as:

```
xml_validate -file filename
[-sch schema_filename] [-log log_filename]
[ -help ] [ -v ]
[ -show ]
```

#### Note that:

- Order of parameters does not matter.
- Bracketed parameters are not mandatory.

Code: Date:

Issue:

Page:

EO-MA-DMS-GS-0007

10/05/2019 4.17 185

- [-v] option for Verbose mode (default is Silent).
- [-show] displays the inputs of the function and the results.
- The filename is validated using the schema\_filename if it is provided. If not, the default schema is used (the one in the root element of the file).
- The validation log is stored in the log\_filename. By default the standard output is used.

#### Example:

xml\_validate -file ../../data/CRYOSAT\_XML\_OSF
-sch ../../../schemas/public/CS\_OPER\_MPL\_ORBSCT\_01.00.XSD
-log log file exe -show

Code: EO-MA-DMS-GS-0007 Date: 10/05/2019

Issue: 4.17 Page: 186

# 7.56.xd\_select\_schema

#### 7.56.1.0verview

The **xd\_select\_schema** returns the most recent schema file name applicable for a given file type and mission.

## 7.56.2. Calling interface

The calling interface of the CFI function is the following (input parameters are <u>underlined</u>):

### 7.56.3.Input parameters

The xd select schema CFI function has the following input parameters:

Table 133: Input parameters of xd\_select\_schema function

| C name | C type      | Array<br>Element | Description<br>(Reference)                                       | Unit<br>(Format) | Allowed<br>Range |
|--------|-------------|------------------|--|------------------|------------------|
| info   | xd_fileinfo |                  | File info containing the mission and the file type (see Table 3) | -                | _                |

# 7.56.4. Output parameters

The output parameters of the xd\_select\_schema CFI function are:

Table 134: Output parameters of xd\_select\_schema function

| C name         | C type | Array<br>Element | Description<br>(Reference)                             | Unit<br>(Format) | Allowed Range |

# 7.57.xd\_orbit\_file\_decimate

#### 7.57.1.0verview

The **xd\_orbit\_file\_decimate** adds capability to configure position interpolator according to user need (decimation).

The decimation is performed in the orbit file structure. This way user has two options using the output of this function:

1.to write a new orbit file and use this file to initialize the orbit id.

2.To initialize directly the orbit id with the new structure.

The fucntion works as follows:

- •First and last state vectors in input list are copied to output list.
- •Using the input decimation delta (D), and being t0 the time of the first state vector of the input list, the state vectors whose time is closer to time t=t0+k\*D (k=1,2...n, t0< t< tn) are copied to output list.

### 7.57.2. Calling interface

The calling interface of the **xd\_orbit\_file\_decimate** CFI function is the following (input parameters are <u>underlined</u>):

## 7.57.3.Input parameters

The xd\_orbit\_file\_decimate CFI function has the following input parameters:

Table 135: Input parameters of xd\_orbit\_file\_decimate function

| C name | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|--------|--------|------------------|----------------------------|------------------|---------------|
|--------|--------|------------------|----------------------------|------------------|---------------|

| fhr_in                    | xd_fhr        |   | Data structure containing the fixed header data read from the input file | -       | -    |
|---------------------------|---------------|---|--|---------|------|
| osv_in                    | xd_orbit_file |   | Data structure containing the data read from the input file              | -       | -    |
| decimation_de<br>lta_time | double        | - | Delta time used for decimation process.                                  | seconds | >=0. |

### 7.57.4. Output parameters

The output parameters of the xd orbit file decimate CFI function are:

Table 136: Output parameters of xd\_orbit\_file\_decimate function

| C name                     | C type        | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|----------------------------|---------------|------------------|---|------------------|---------------|
| xd_orbit_file_decima<br>te | long          | -                | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                |               |
| fhr_out                    | xd_fhr        |                  | Data structure containing the fixed header for output file  |                  |               |
| osv_out                    | xd_orbit_file |                  | Data structure containing the output file data  | -                | -             |
| ierr                       | long[]        | -                | Error vector  | -                | -             |

<u>Memory Management</u>: The *osv\_out* structure contains pointers to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd** free orbit file

Issue: 4.17 Page: 190

### 7.57.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_orbit\_file\_decimate** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_orbit\_file\_decimate** function by calling the function of the EO DATA HANDLING software library **xd get code** (see [GEN SUM])

Table 137: Error messages of xd\_orbit\_file\_decimate function

| Error type | Error message  | Cause and impact         | Error code                              | Error<br>No |
|------------|--|--------------------------|---|-------------|
| ERR        | Error allocating memory  |                          | XD_ORBIT_FILE_DECIMAT<br>E_MEM_ERR      | 0           |
|            | The time difference between 2 consecutive OSVs is greater than twice input time decimation delta | •                        | XD_ORBIT_FILE_DECIMAT<br>E_DELTA_WARN   | 1           |

# 7.58.xd\_attitude\_file\_decimate

#### 7.58.1.0verview

The xd attitude file decimate adds capability to configure attitude interpolator according to user need (decimation).

The decimation is performed in the attitude file structure. This way user has two options using the output of this function:

1.to write a new attitude file and use this file to initialize the attitude id.

2. To initialize directly the attitude id with the new structure.

The fucntion works as follows:

- •First and last attitude records in input list are copied to output list.
- •Using the input decimation delta (D), and being t0 the time of the first attitude record of the input list, the attitude records whose time is closer to time t=t0+k\*D (k=1, 2...n, t0 < t < tn) are copied to output list.

### 7.58.2. Calling interface

The calling interface of the xd attitude file decimate CFI function is the following (input parameters are underlined):

```
#include <explorer data handling.h>
 xd fhr fhr in, fhr out;
 xd att file att in, att out;
 double decimation delta time;
 long ierr[XD NUM ERR ATTITUDE FILE DECIMATE];
 status = xd attitude file decimate (&fhr in, &att in,
                                     decimation delta time,
                                      &fhr out, &att out,
                                      ierr);
}
```

## 7.58.3.Input parameters

The xd\_attitude\_file\_decimate CFI function has the following input parameters:

Table 138: Input parameters of xd\_attitude\_file\_decimate function

| C name | C type Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|--------|-------------------------|----------------------------|------------------|---------------|
|--------|-------------------------|----------------------------|------------------|---------------|

| fhr_in                    | xd_fhr      |   | Data structure containing the fixed header data read from the input file | -       | -    |
|---------------------------|-------------|---|--|---------|------|
| att_in                    | xd_att_file |   | Data structure containing the data read from the input file              | _       | -    |
| decimation_de<br>lta_time | double      | - | Delta time used for decimation process.                                  | seconds | >=0. |

### 7.58.4. Output parameters

The output parameters of the xd\_attitude\_file\_decimate CFI function are:

Table 139: Output parameters of xd\_attitude\_file\_decimate function

| C name                        | C type      | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|-------------------------------|-------------|------------------|---|------------------|---------------|
| xd_attitude_file_deci<br>mate | long        |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                |               |
| fhr_out                       | xd_fhr      |                  | Data structure containing the fixed header for output file  |                  |               |
| att_out                       | xd_att_file |                  | Data structure containing the output file data  | -                | -             |
| ierr                          | long[]      | -                | Error vector  | -                | -             |

<u>Memory Management</u>: The *osv\_out* structure contains pointers to memory allocated dinamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd** free att.

Issue: 4.17 Page: 193

### 7.58.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_attitude\_file\_decimate** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_attitude\_file\_decimate** function by calling the function of the EO DATA HANDLING software library **xd get code** (see [GEN SUM])

Table 140: Error messages of xd\_attitude\_file\_decimate function

| Error type | Error message  | Cause and impact | Error code   | Error<br>No |
|------------|--|------------------|--|-------------|
| ERR        | Error allocating memory  | •                | XD_CFI_ATTITUDE_FILE_D<br>ECIMATE_MEM_ERR              | 0           |
| WARN       | The time difference between 2 consecutive records is greater than twice input time decimation delta  |                  | XD_CFI_ATTITUDE_FILE_D<br>ECIMATE_DELTA_WARN           | 1           |
| ERR        | Error computing validity interval  | •                | XD_CFI_ATTITUDE_FILE_D<br>ECIMATE_VAL_TIME_ERR         | 2           |
| WARN       | Attitude record reference not UTC. UTC Validity interval computed extending one minute or more (rounded to have exact number of minutes) every end of interval | •                | XD_CFI_ATTITUDE_FILE_D<br>ECIMATE_ATT_NOT_UTC_<br>WARN | 3           |

# 7.59.xd\_xslt\_add

#### 7.59.1.0verview

The xd xslt add function adds to the input file the <xml-stylesheet> tag with reference to the default style sheet.

If the tag already exists it will be updated.

The default style sheet is determined by the **file type** and by the **attitude type** (in the case of attitude files). The correspondence can be found in the following table:

Note: examples of style sheets can be found in the distribution package, in the directory files/xslt.

| File Type                     | Attitude Type | Default styles sheet |
|-------------------------------|---------------|----------------------|
| Reference Orbit Scenario File | N/A           | OSF.xslt             |
| Predicted Orbit File          | N/A           | OSV_list.xslt        |
| Doris Navigator File          | N/A           | OSV_list.xslt        |
| Restituted Orbit File         | N/A           | OSV_list.xslt        |
| Doris Preliminary Orbit File  | N/A           | OSV_list.xslt        |
| Doris Precise Orbit File      | N/A           | OSV_list.xslt        |
| Attitude File                 | Quaternions   | att_quaternions.xslt |
| Attitude File                 | Angles        | att_angles.xslt      |

## 7.59.2. Calling interface

The calling interface of the xd\_xslt\_add CFI function is the following (input parameters are underlined):

```
#include <explorer_data handling.h>
{
      char fname in[];
      long ierr[XD NUM ERR XSLT ADD];
      status = xd xslt add(filename, ierr);
}
```

Issue: 4.17 Page: 195

#### 7.59.3.Input parameters

The xd xslt add CFI function has the following input parameters:

Table 141: Input parameters of xd\_xslt\_add function

| C name   | C type | Array<br>Element | Description<br>(Reference)                            | Unit<br>(Format) | Allowed Range |
|----------|--------|------------------|---|------------------|---------------|
| fname_in | char*  |                  | The xml file that will be updated with xslt reference |                  | -             |

#### 7.59.4. Output parameters

The output parameters of the xd xslt add CFI function are:

Table 142: Output parameters of xd\_xslt\_add function

| C name | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|--------|--------|------------------|----------------------------|------------------|---------------|

10/05/2019 4.17 197

# 7.60.xd\_read\_oem

#### 7.60.1.0verview

The xd\_read\_oem CFI function reads Orbit Ephemeris Message files.

The following items must be considered:

A warning is raised if at least one of the following conditions is detected:

- time going back OSV
- repeated OSV

### 7.60.2. Calling interface

The calling interface of the xd read oem CFI function is the following (input parameters are <u>underlined</u>):

## 7.60.3.Input parameters

The xd read oem CFI function has the following input parameters:

Table 144: Input parameters of xd\_read\_oem function

|   | C name  | C type | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|---|---------|--------|------------------|----------------------------|------------------|---------------|
| c | em_file | char*  | -                | OEM file name              | -                | -             |

|  |  | Configuration for reading OSV state vectors |  |  |
|--|--|---|--|--|
|--|--|---|--|--|

It is possible to use enumeration values rather than integer values for some of the input arguments:

• Time model ID: time mode. See [GEN SUM].

#### 7.60.4. Output parameters

The output parameters of the xd read oem CFI function are:

Table 145: Output parameters of xd\_read\_oem function

| C name   | C type      | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed<br>Range |
|----------|-------------|------------------|---|------------------|------------------|
| status   | long        |                  | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                |                  |
| oem_data | xd_oem_file | -                | OEM data  | -                | -                |
| ierr     | long[]      | -                | Error vector  | -                | -                |

<u>Memory Management</u>: The *oem\_data* structure contains pointers to memory allocated dynamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd\_free\_oem**.

# 7.60.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_read\_oem** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd\_get\_msg** (see [GEN\_SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_oem** function by calling the function of the EO\_DATA\_HANDLING software library **xd get code** (see [GEN SUM])

# 7.61.xd\_free\_oem

#### 7.61.1.0verview

The xd free oem CFI function frees the memory allocated during the reading function xd read oem.

### 7.61.2. Calling interface

The calling interface of the xd free oem CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer data handling.h>
 xd oem file oem data xd free oem (&oem data);
```

### 7.61.3.Input parameters

The xd free oem CFI function has the following input parameters:

Table 147: Input parameters of xd\_free\_oem function

| C name   | C type          | Array<br>Element | Description<br>(Reference) | Unit<br>(Format) | Allowed Range |
|----------|-----------------|------------------|----------------------------|------------------|---------------|
| oem_data | xd_oem<br>_file | -                | OEM data structure         | _                | -             |

# 7.61.4. Output parameters

This function does not return any value nor parameters.

Code: Date: Issue:

EO-MA-DMS-GS-0007 10/05/2019

> 4.17 201

# 7.62.xd\_orbit\_file\_diagnostics

#### 7.62.1.0verview

The xd orbit file diagnostics CFI function computes diagnostics data related to an orbit file. Such data can be analysed to detect problems in the file or identify fragments of the file to be discarded. The following information is returned:

- Size of the interval covered by the file.
- Times of first and last OSV.
- Number and interval of GAPs in the file.
- Number and indexes of duplicated OSVs, i.e. OSVs whose time is the same as the one of previous OSV; i.e. if time osv1 and time osv2 are the times of one OSV and the following one respectively, the duplicated OSVs fulfill the following condition:

```
|time osv2-time osv1| < diagnostics settings.duplicated osv threshold
```

- being diagnostics settings one input parameter to the function (check section 7.62.2).
- Number and indexes of the OSVs going back in time, i.e. OSVs whose time is in the past with respect to the previous one; i.e. the OSVs are not identified as duplicated OSVs and fulfill the following conditions:

```
1) time osv2-time osvl < 0.
```

- 2)  $|time\ osv2-time\ osv1| > diagnostics\ settings.duplicated\ osv\ threshold$
- Number and indexes of OSVs with inconsistent orbit number (i.e. OSVs whose number is not correlated with its neighbours OSVs).
- Number and indexes of OSVs with non-equally spaced OSVs (i.e. OSVs that are separated from its neighbours a different step from the one expected).

For DORIS files only EF OSVS are checked, because they are the ones used by orbit initialization.

# 7.62.2. Calling interface

The calling interface of the xd orbit file diagnostics CFI function is the following (input parameters are underlined):

```
#include <explorer data handling.h>
 long status;
 char *input file;
 xd orbit file diagnostics settings diagnostics settings;
 xd orbit file diagnostics report diagnostics report;
```

### 7.62.3.Input parameters

The xd orbit file diagnostics CFI function has the following input parameters:

Table 148: Input parameters of xd\_orbit\_file\_diagnostics function

| C name               | C type                                 | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed Range |
|----------------------|--|------------------|---|------------------|---------------|
| input_file           | char*                                  |                  | The file that will be checked for diagnostics. The file must have one of the following types: |                  | -             |
| eocfi_file           | xd_eocfi_file *                        |                  | Data from an EOCFI file:  | -                | -             |
| diagnostics_settings | xd_orbit_file_diag<br>nostics_settings | -                | Diagnostic settings<br>structure  | -                | -             |

# 7.62.4. Output parameters

The output parameters of the xd\_orbit\_file\_diagnostics CFI function are:

Code: EO-MA-DMS-GS-0007 Date: 10/05/2019

Issue: 4.17 Page: 203

Table 149: Output parameters of xd\_orbit\_file\_diagnostics function

| C name             | C type                               | Array<br>Element | Description<br>(Reference)  | Unit<br>(Format) | Allowed<br>Range |
|--------------------|--------------------------------------|------------------|---|------------------|------------------|
| status             | long                                 | -                | Function status flag:  • = 0 No error  • > 0 Warnings, results generated  • < 0 Error, no results generated | -                | -                |
| diagnostics_report | xd_orbit_file_diag<br>nostics_report | -                | Diagnostics report structure  | -                | -                |
| ierr               | long[]                               | -                | Error vector  | -                | -                |

<u>Memory Management</u>: The *xd\_orbit\_file\_diagnostics\_report* structure contains pointers to memory allocated dynamically. In order to avoid memory leaks, the user will have to free that memory when the data structure is not to be used any more. The memory can be freed by calling to the CFI function **xd\_free\_orbit\_file\_diagnostics\_report**.

#### 7.62.5. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_orbit\_file\_diagnostics** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO DATA HANDLING software library **xd get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_read\_oem** function by calling the function of the EO\_DATA\_HANDLING software library **xd get code** (see [GEN SUM])

Table 150: Error messages of xd\_orbit\_file\_diagnostics function

| Error<br>type | Error message   | Cause and impact         | Error code                 | Error<br>No |

# 7.63.xd\_free\_orbit\_file\_diagnostics\_report

#### 7.63.1.0verview

The xd\_free\_orbit\_file\_diagnostics\_report CFI function frees the memory allocated by the function xd\_orbit\_file\_diagnostics.

## 7.63.2. Calling interface

The calling interface of the **xd\_free\_orbit\_file\_diagnostics\_report** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
    xd_orbit_file_diagnostics_report diagnostics_report;
    xd_free_orbit_file_diagnostics_report (&diagnostics_report);
}
```

### 7.63.3.Input parameters

The xd\_free\_orbit\_file\_diagnostics\_report CFI function has the following input parameters:

Table 151: Input parameters of xd\_free\_orbit\_file\_diagnostics\_report function

| C name | C type                               | Array<br>Element | Description<br>(Reference)      | Unit<br>(Format) | Allowed Range |
|--------|--------------------------------------|------------------|---------------------------------|------------------|---------------|
| 1 = :  | xd_orbit_file_dia<br>gnostics_report |                  | Diagnostics report<br>structure | _                | -             |

# 7.63.4. Output parameters

This function does not return any value nor parameters.

# 7.64.xd\_set\_file\_format\_standard\_version

#### 7.64.1.0verview

The **xd\_set\_file\_format\_standard\_version** CFI function sets the version of the Earth Observation Ground Segment File Format Standard used by the EOCFI functions to generate, write and read files.

The version used by default is mission dependent, see section Error: Reference source not found. Calling xd set file format standard version overrides the version number for all missions.

Calling xd\_set\_file\_format\_standard\_version with input eoffs=XD\_FFS\_DEFAULT re-sets the default mission dependent value.

### 7.64.2. Calling interface

The calling interface of the **xd\_set\_file\_format\_standard\_version** CFI function is the following (input parameters are <u>underlined</u>):

```
#include <explorer_data_handling.h>
{
  long status;
  long eoffs;
  long ierr[XD_NUM_ERR_SET_FILE_FORMAT_STANDARD_VERSION];
  status = xd_set_file_format_standard_version(eoffs,ierr);
}
```

# 7.64.3.Input parameters

The xd\_set\_file\_format\_standard\_version CFI function has the following input parameters:

Table 152: Input parameters of xd\_set\_file\_format\_standard\_version function

| C name | C type | Array<br>Element | Description<br>(Reference)   | Unit<br>(Format) | Allowed Range  |
|--------|--------|------------------|------------------------------|------------------|--|
| eoffs  | long   | _                | File Format Standard version |                  | Allowed values:<br>XD_FFS_DEFAULT<br>XD_FFS_V1<br>XD_FFS_V2<br>XD_FFS_V3 |

Output parameters

The output parameters of the xd set file format standard version CFI function are:

|--------|--------|------------------|----------------------------|------------------|---------------|
| ierr   | long[] | -                | Error vector               | -                | -             |

## 7.64.4. Warnings and errors

Next table lists the possible error messages that can be returned by the **xd\_set\_file\_format\_standard\_version** CFI function after translating the returned error vector into the equivalent list of error messages by calling the function of the EO\_DATA\_HANDLING software library **xd get msg** (see [GEN SUM]).

This table also indicates the type of message returned, i.e. either a warning (WARN) or an error (ERR), the cause of such a message and the impact on the performed calculation.

The table is completed by the error code and value. These error codes can be obtained translating the error vector returned by the **xd\_set\_file\_format\_standard\_version** function by calling the function of the EO DATA HANDLING software library **xd get code** (see [GEN SUM])

Table 154: Error messages of xd\_set\_file\_format\_standard\_version function

| Error type | Error message              | Cause and impact | Error code  | Error<br>No |
|------------|----------------------------|------------------|---|-------------|
| ERR        | Error in set eoffs version | •                | XD_CFI_SET_FILE_FORMA<br>T_STANDARD_VERSION_<br>WRONG_INPUT_ERR | 0           |

# 8. SUPPORTED FILE TYPES

# 8.1.Summary

Table 155 lists the file types that are supported by the EOCFI SW. The table indicates for each file type if the file can be read and/or written (RW column), if it is compliant with EO Ground Segment File Format Standard (FFS) [FFS3] and [FFS2] (FFS column).

Table 155: List of Earth Observation Ground Segment Files

| File Type                             | Description  | R/W | FFS | Format Described in          |
|---------------------------------------|--|-----|-----|------------------------------|
| Predicted Orbit File                  | List of Orbit State Vectors (i.e.<br>position and velocity at given<br>times), one per orbit |     |     | [EO_ICD], section 3.1 (*)    |

- (\*) The Data Block of these files have identical format, the only difference is the name of the validating schema.
- (\*\*) these formats are deprecated for any mission except for CryoSat-2 and is maintained for backward compatibility
- (\*\*\*) these formats are deprecated for any mission except for Sentinel-3 and is maintained for backward compatibility

#### 8,2, File Format Version

For files compliant with FFS, a format version number is maintained to keep track of format modifications.

Each format version has an associated validating schema file. The format version is encoded in the schema file name (e.g. the validating schema for Orbit Scenario File Format version 3.1 is named EO\_OPER\_MPL\_ORBSCT\_0301.XSD). Validating schemas can be found in the EOCFI SW distribution package and at this URL: http://eop-cfi.esa.int/CFI/EE\_CFI\_SCHEMAS/

Table 156 provides, for each File Type and File Format Standard Version, the latest File Format Version and the relevant validating schema.

Table 156: Mapping between File Types, FFS Version, File Format Version and validating schemas

| File Type             | FFS<br>Version | File<br>Format<br>Version | Validating schema           |
|-----------------------|----------------|---------------------------|-----------------------------|
|                       | 1.0            | 1.5                       | EO_OPER_MPL_ORBPRE_0105.XSD |

#### The EOCFI SW:

- Is able to read files of latest format versions listed in Table 2 regardless of the File Format Standard.
- Is able to read files of older format versions listed in Table 5 regardless of the File Format Standard.
- Writes files of format listed in Table 156 using the applicable File Format Standard Version. The applicable File Format Standard Version is mission dependent, the correspondence between missions and applicable File Format Standard Version is given in Table 158. The default can be overridden by using function **xd set file format standard version** (section 7.64).

Table 158: Mapping between Missions and applicable FFS Version

| Mission                               | Applicable FFS Version |
|---------------------------------------|------------------------|
| ERS-1, ERS-2                          |                        |
| ENVISAT                               |                        |
| Metop-A, Metop-B, Metop-C             |                        |
| CryoSat-2                             |                        |

# 8.3. File Format Specification

This section provides the description of file formats that are not specified in [EO ICD].

For files compliant with File Format Standard, the specification includes:

- the content of the Variable Header;
- the content of the Data Block;
- the reference to the validating schema for FFS v3.0 (shortly named "Schema Reference"), of FFS v1.4 for files only applicable to CryoSat.

# 8.3.1.DEM Configuration File

### 8.3.1.1. Variable Header

The Variable Header is empty for this file type.

### 8.3.1.2. Data Block

The Data Block content is a sequence of XML elements described in Table 160.

#### Table 160: Data Block content

| XML Tag name | Type      | Attributes | C Format | Description                  |
|--------------|-----------|------------|----------|------------------------------|
| DEM          | Structure | -          | =        | Structure containing the DEM |
|              | (see      |            |          | model.                       |
|              | Table     |            |          |                              |
|              | 161)      |            |          |                              |

#### Table 161: DEM structure

| XML Tag name        | Type                            | Attributes | C Format | Description                              |
|---------------------|---------------------------------|------------|----------|--|
| DEM_User_Parameters | Structure<br>(see Table<br>162) | -          | -        | Structure containing the User parameters |
| DEM_Metadata        | Structure<br>(see Table<br>163) | -          | -        | Structure containing the DEM Metadata.   |

### Table 162: DEM\_User\_Parameters structure

| XML Tag name            | Type                    | Attributes | C Format | Description  |
|-------------------------|-------------------------|------------|----------|--|
| Directory               | string                  | -          |          | Directory where all DEM files are located. It can be an absolute or relative path. All files shall be located in the same directory. About supported DEM types, see [MCD], section 8.2.5. If the tag is empty, the DEM files are looked for in the same directory where the DEM configuration file is located. |
| Cache_Type              | string                  | -          |          | Type of cache used for DEM computations.  Possible values:  NO_CACHE  PRELOAD_CACHE  FIFO_CACHE  |
| Cache_Max_Size          | integer                 | size="MB"  | %d       | Maximum size of memory cache   |
| MiniTiles_Configuration | Structure<br>(see Table | -          | -        | Mini tile configuration for DEM maximum altitude algorithm   |

|                     | 164)    |   |    |   |
|---------------------|---------|---|----|---|
| Geoid_Computation   | string  |   | %s | Flag to indicate if geoid correction must be performed or not in DEM computations.  Possible values:  Enabled  Disabled |
| Geoid_Nof_Harmonics | integer | - | %d | Number of harmonics to be used in geoid correction computation.   |

Table 163: DEM\_Metadata structure

| XML Tag name  | Type    | Attributes | C Format | Description   |
|---------------|---------|------------|----------|---|
| Dataset_Model | String  | -          |          | Supported dataset models (see [MCD], section  |
|               |         |            |          | 8.2.5).   |
|               |         |            |          | DEM model:  ACE2_3SEC  ACE2_30SEC  ACE2_9SEC  ACE2_5MIN  GDEM_V2  GENERIC (*)  GETASSE30_V1  GETASSE30_V2 |
| Description   | Ctuin a |            | 0/ -     | GETASSE30_V3  DEM description   |
| Description   | String  | <b>†</b>   | %s       | DEM description   |

<sup>(\*)</sup> When GENERIC type is used, the file describing the raster (DEM Generic Raster Configuration File) must be also generated. The description of this file can be found in [EO\_ICD].

Table 164: Mini tile configuration

| XML Tag name | Type   | Attributes | C Format | Description   |
|--------------|--------|------------|----------|---|
| Filename     | String | -          |          | Filename or path of the maximum altitude binary file. |
| Lon_Size     | Real   | unit="deg" | %d       | Longitude size of mini tiles                          |
| Lat_Size     | Real   | unit="deg" | %d       | Latitude size of mini tiles                           |

#### 8.3.1.3. Schema Reference

An example of validating XML schema for this file type is located at:

### http://eop-cfi.esa.int/CFI/EE\_CFI\_SCHEMAS/EO\_OPER\_INT\_DEMCFG\_0302.XSD

This schema is compliant to [EO\_SCH\_HB] and includes format and range checks to ensure compliance to this specification and to the File Format Standard [FFS3]. The schema file is named according to section 6.1.1 in [EO\_SCH\_HB] and is applicable to files named MMM **OPER INT DEMCFG** <instance id>.EOF.

The following is the content of the Earth\_Observation\_File required to reference the above schema.

```
<Earth_Observation_File xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:schemaLocation="http://eop-cfi.esa.int/CFI http://eop-cfi.esa.int/CFI/EE_CFI_SCHEMAS/EO_OPER_INT_DEMCFG_0302.XSD" schemaVersion="3.2"
xmlns="http://eop-cfi.esa.int/CFI">
```

## 8.3.2. Precise Propagator Configuration File

#### 8.3.2.1. Variable Header

The Variable Header is empty for this file type.

#### 8.3.2.2. <u>Data Block</u>

The Data Block content is a sequence of XML elements described in Table 165.

Table 165: Data Block content

| XML Tag name    | Type            | Attributes | C Format | Description   |
|-----------------|-----------------|------------|----------|---|
| Models_Path     | string          | -          | %s       | Path where files neccesary for models are looked for.               |
| Gravity_Flag    | long<br>integer | -          | %ld      | Gravity perturbation used (1) or not (0).                           |
| Thirdbody_Flag  | long<br>integer | -          | %ld      | Third bodies (Sun and Moon)<br>perturbation used (1) or not<br>(0). |
| Atmosphere_Flag | long<br>integer | -          | %ld      | Atmosphere perturbation used (1) or not (0).                        |
| Srp_Flag        | long<br>integer | -          | %ld      | Solar radiation pressure per-<br>turbation used (1) or not (0).     |
| Time_Step       | real            | unit="s"   | %lf      | Simulation step.  |
| Gravity_File    | string          | _          | %s       | File with data of gravitational model.                              |
| Gravity_Degree  | long<br>integer | -          | %ld      | Degree used gravity model.  |

| Gravity_Order | long<br>integer | -         | %ld | Order used in gravity model.                                      |
|---------------|-----------------|-----------|-----|---|
| Sga_Flag      | long<br>integer | -         | %ld | Parameters used (0) or data read from file (1).                   |
| Sga_Ap_File   | string          | -         | %s  | File with Geomagnetic Activ-<br>ity index values.                 |
| Sga_F107_File | string          | -         | %s  | File with F10.7 Solar Activity index values                       |
| AP            | real            | -         | %lf | Geomagnetic Activity Index (daily value).                         |
| F107          | real            | -         | %lf | F10.7 Index Solar Activy<br>Index (daily value).                  |
| F107A         | real            | -         | %lf | F10.7 Index Solar Activy<br>Index (value averaged over 3 months). |
| SC_Mass       | real            | unit="kg" | %lf | S/C mass.   |
| SC_Drag_Area  | real            | unit="m2" | %lf | S/C effective drag area.  |
| SC_Drag_Coef  | real            | -         | %lf | S/C drag coefficient.   |
| SC_Srp_Area   | real            | unit="m2" | %lf | S/C effective SRP area.   |
| SC_Srp_Coef   | real            | -         | %lf | S/C SRP coefficient.  |

```
<Data_Block type="xml">
   <Models_Path>/models_full_path/models/Models_Path>

#### 8.3.2.3. Schema Reference

An example of validating XML schema for this file type is located at:

http://eop-cfi.esa.int/CFI/EE CFI SCHEMAS/EO OPER INT PPRCFG 0300.XSD

This schema is compliant to [EO\_SCH\_HB] and includes format and range checks to ensure compliance to this specification and to the File Format Standard [FFS3]. The schema file is named according to section 6.1.1 in [EO\_SCH\_HB] and is applicable to files named MMM **OPER INT PPRCFG** <instance id>.EOF.

The following is the content of the Earth Observation File required to reference the above schema.

<Earth\_Observation\_File xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:schemaLocation="http://eop-cfi.esa.int/CFI http://eop-cfi.esa.int/CFI/EE\_CFI\_SCHEMAS/EO\_OPER\_INT\_PPRCFG\_0300.XSD" schemaVersion="3.0"
xmlns="http://eop-cfi.esa.int/CFI">

### 8.3.3.TLE File

The format of the TLE files are described in [TLE].

A few TLE items (Name, Designator, Catalog Number) are part of the NORAD Satellite Catalog (SATCAT) and are assigned by NORAD after satellite launch.

The EOCFI SW uses, for each pre-defined satellite ID, a set of default SATCAT items as defined in table Table 239: NORAD Identifiers for satellites.

For non pre-defined satellite IDs (i.e. "Default" Satellites, see section 7.2 of [GEN\_SUM], the NORAD SATCAT items can be set directly via the satellite configuration file, see [EO ICD]).

The user can change such default values by using function xl\_set\_tle\_sat\_data (see section 7.48 of [LIB SUM]).

Table 166: NORAD Identifiers for satellites

| Satellite ID       | NORAD Satellite<br>Number | NORAD Satellite<br>Name | NORAD International<br>Designator |
|--------------------|---------------------------|-------------------------|-----------------------------------|
| XD_SAT_ERS1        | 21574                     | ERS1                    | "91050A "                         |
| XD_SAT_ERS2        | 23560                     | ERS2                    | "95021A "                         |
| XD_SAT_ENVISAT     | 27386                     | ENVISAT                 | "02009A "                         |

# 8.3.4.Extended Standard Product 3 Orbit File (SP3-c)

The format of the SP3 files is described in [SP3].

## 8.3.5. Orbit Ephemeris Message File (OEM)

The format of the OEM files is described in [OEM].

Table 167 shows the mapping between the OEM file and the CFI structure xd\_oem\_file. The fields that are **not** read by the function **xd\_read\_oem** are marked with N/A.

Table 167: List of OEM fields read by EOCFI

| OEM File<br>Section | OEM File Field | xd_oem_file field | Notes |

### 8.3.6. IERS Bulletins

The EOCFI SW is able to read IERS Bulletins A, B, B (IAU1980), B (IAU2000), as described in [IERS].

## 8.3.7.CryoSat-2 Orbit Event File

### 8.3.7.1. Variable Header

The Variable Header has the same format as for Orbit State Vector Files (see reference [EO ICD]).

### 8.3.7.2. Data Block

The Data Block content is a sequence of XML elements described in Table 169.

Table 169: Data Block content

| XML Tag name | Type                          | Attributes | C Format | Description                                |

#### 8.3.7.3. Schema Reference

An example of validating XML schema for this file type is located at:

```
http://eop-cfi.esa.int/CFI/EE CFI SCHEMAS/EO OPER MPL ORBREF 0106.XSD
```

This schema is compliant to [EO\_SCH\_HB] and includes format and range checks to ensure compliance to this specification and to the File Format Standard [FFS1]. The schema file is named according to section 6.1.1 in [EO\_SCH\_HB] and is applicable to files named MM OPER MPL\_ORBREF <instance id>.EOF.

The following is the content of the Earth Explorer File required to reference the above schema.

Code: EO-MA-DMS-GS-0007 Date: 10/05/2019

Issue: 4.17 Page: 227

<Earth\_Explorer\_File xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:schemaLocation="http://eop-cfi.esa.int/ CFI http://eop-cfi.esa.int/CFI/EE\_CFI\_SCHEMAS/EO\_OPER\_MPL\_ORBREF\_0106.XSD" schemaVersion="1.6" xmlns="http://eop-cfi.esa.int/CFI">

## 8.3.8.CryoSat-2 DORIS Navigator File

The format of the Cryosat-2 DORIS Navigator files is described in [PDS FMT].

## 8.3.9. Sentinel-3 DORIS Navigator File

The format of the Sentinel-3 DORIS Navigator files is described in [PDGS S3].

## 8.3.10.CryoSat-2 Star Tracker File

A Star tracker file consists in a couple of files: the CryoSat standard header file and the data block file. They are compliant with [PDS\_FMT].

## 8.3.11.CryoSat-2 Star Tracker Configuration File

#### 8.3.11.1. Variable Header

The Variable Header is empty for this file type.

#### 8.3.11.2. <u>Data Block</u>

The Data Block content is a sequence of XML elements described in Table 170.

### Table 170: Data Block content

| XML Tag name   | Type                               | Attributes | C Format | Description   |
|----------------|------------------------------------|------------|----------|---|
| Satellite_Name | string                             | -          | %s       | Satellite Name  |
| Mispointing    | Structure<br>(See<br>Table<br>171) | -          |          | Set of rotation angles needed for mispointing computation |

#### Table 171: Mispointing

| XML Tag name          | Type   | Attributes | C Format | Description   |
|-----------------------|--------|------------|----------|---|
| Aberration_Correction | string |            |          | Aberration correction flag. Possible values are:  • Yes: for applying the aberration- correction.                           |
|                       |        |            |          | <ul><li>No: for not applying the aberration correction.</li><li>Reverse: for applying the aberra- tion correction</li></ul> |

### 8.3.11.3. Schema Reference

An example of validating XML schema for this file type is located at:

http://eop-cfi.esa.int/CFI/EE CFI SCHEMAS/EO OPER INT STRCFG 0102.XSD

This schema is compliant to [EO\_SCH\_HB] and includes format and range checks to ensure compliance to this specification and to the File Format Standard [FFS1]. The schema file is named according to section 6.1.1 in [EO\_SCH\_HB] and is applicable to files named MM **OPER MPL STRCFG** <instance id>.EOF.

The following is the content of the Earth Explorer File required to reference the above schema.

CEarth\_Explorer\_File xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:schemaLocation="http://eop-cfi.esa.int/
CFI http://eop-cfi.esa.int/CFI/EE\_CFI\_SCHEMAS/EO\_OPER\_INT\_STRCFG\_0102.XSD" schemaVersion="1.2" xmlns="http://eop-cfi.esa.int/CFI">

9. RUNTIME PERFORMANCES

The library performance has been measured by dedicated test procedures run in 5 different platforms under the below specified machines:

| OS ID          | Processor  | os   | RAM   |
|----------------|--|--|-------|
| LINUX64        | Intel(R) Xeon(R) CPU E5-<br>2609 v4 @ 1.70GHz (8<br>cores) | GNU LINUX 4.10.0-42-generic (Ubuntu 17.04) | 64 GB |
| LINUX64_LEGACY | Intel(R) Xeon(R) CPU E5-<br>2470 0 @ 2.30GHz (16<br>cores) | GNU LINUX 2.6.24-16-generic (Ubuntu 10.10) | 16 GB |
| MACIN64        | Intel Core i7 4 cores @2,6<br>GHz                          | MACOSX 10.12                               | 16 GB |
| WINDOWS64      | Intel(R) Xeon(R)CPU ES-<br>2630 @ 2.40GHz<br>2.40GHz       | Microsoft Windows 7 (or superior)          | 16 GB |

The table below shows the time (in miliseconds - ms) each function takes to be run under each platform:

| Function ID                            | WINDOWS64 | LINUX64  | LINUX64<br>LEGACY | MACIN64  |
